| 9 00 | Clear and unclouded - - - - - | - | | Bright streamers in N. and N. W., altitude 60° - - - - - | - |
| 10 00 | Clear and unclouded - - - - - | - | | Faint light and streamers - - - - - | - |
| 20 | Bank of auroral light in N., with streamers and patches - - | - | | Clear arch of light in N., altitude of centre 15° - - - - - | - |
| 11 00 | Clear and unclouded; auroral light in N., an arch of small streamers extending from N.W. to N.E.; altitude of highest part about 40° ; length of streamers in centre of arch about $1^{\circ} 30'$; getting gradually shorter towards each extremity - | - | | Arch of light as before; no streamers visible - - - - - | - |
| 12 00 | Clear and unclouded; a faint auroral light in N. - - - | - | | Perfectly clear; no aurora visible - - - - - | - |
| 13 00 | Quite clear; a low and very faint bank of auroral light in N. - | - | | Clear and unclouded; bank of light in N. - - - - - | - |
| AUGUST. | | | | | |
| 29 9 00 | Unclouded, save low bank of cir.-strat. in S.E. horizon - - | 15·2 | OCTOBER. | | |
| 10 | Sudden appearance of an aurora; moderately bright streamers and patches - - - - - | - | 20 12 00 | Cir. and cir.-strat., dispersed auroral light in N. - - - | 8·3 |
| 9 30 | Aurora totally disappeared - - - - - | - | 40 | Aurora very bright, shooting up streamers to altitude of 45° ; bright bank in N. horizon; waves rising in succession from horizon and reaching to zenith - - - - - | - |
| 40 | No aurora visible; sky clear save a low bank of cir.-strat. in S.E. horizon - - - - - | - | 13 00 | Bright bank of auroral light in N. horizon, with streamers and patches - - - - - | - |
| 10 00 | Clear save a few cir.-strat. in S.W. and S.E. horizon - - | - | 30 | Bright bank of auroral light in N., with streamers; waves reaching to zenith - - - - - | - |
| 10 | Very faint auroral light in N.; low bank of strat. in W. - | - | | Faint auroral light in N.; streaky light cir. in ridges stretching from E. to W. - - - - - | - |
| 15 | A number of small streamers or fragments of streamers appearing about 10° N. of zenith - - - - - | - | | | |
| 20 | No traces of the aurora; sheet of cir.-strat. rising in N.W. horizon - - - - - | - | | | |

MAGNETICAL OBSERVATIONS.

DECLINATION.

Angular Value of one Scale Division of the Declinometer = $0^{\circ} 721$. Increasing Numbers denote decreasing Westerly Declination.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0' \cdot 721$. Increasing numbers denote decreasing Westerly Declination.

DECLINATION.

Angular Value of one Scale Division of the Declinometer = $0' \cdot 721$. Increasing numbers denote decreasing Westerly Declination.

TORONTO, 1842. MAGNETICAL OBSERVATIONS.

TIMES OF OBSERVATION at which the MAGNETOMETERS were disturbed, but the mean readings were not materially changed.

(Continued from the record for 1841, in the first part of the first volume of Observations on Days of Unusual Magnetic Disturbance.)

The H. F. magnet is said to be "considerably" or "very much" disturbed when it vibrates in an arc of 35 to 45 scale divisions; to be "much" disturbed when it vibrates in an arc of 20 to 35 divisions; "moderately" when in an arc of 10 to 20 divisions; and "slightly" when in an arc of 5 to 10 divisions. The same terms are used for the Declin. Magnet when it vibrates through half the above number of scale divisions. The times are Mean Toronto Time, astronomical reckoning.

The following Memorandum regarding the elements of the calculations of the Absolute Horizontal Force Observations has been supplied by CAPTAIN YOUNGHUSBAND.

THE series of observations of Absolute Horizontal Intensity detailed in this volume was commenced in January 1845, and continued without any interruption whatever to December 1852; it extends therefore over a period of eight complete years.

The observations were made on three days in each month, always about the same part of the month, the first day being on or about the 16th. Generally three distances were employed, and complete experiments of deflection and vibration made on each day. The instrument with which the observations were made was the portable unifilar magnetometer, and the same instrument, and the same deflecting magnet has been used throughout the whole series. The *near end* of the deflecting magnet was placed at 1·0, 1·1, 1·2, and occasionally at 1·3 feet from the centre of the suspended magnet; consequently the distances of deflection were 1·0, 1·1, 1·2, and 1·3 feet, + in each case half the length of the deflecting magnet. These distances correspond to 1·1527, 1·2527, 1·3527, &c. feet, as graduated on the deflecting tube of the unifilar, and the observations were calculated at Toronto in accordance with these data, to the end of the year 1851; but a very careful measurement of the graduation having been made by Captain Lefroy in October, 1851, by means of a beam compass, and referred to a brass standard measure of Troughton and Simms' manufacture, the true distances were found to be 1·1508, 1·2508, 1·3508, and 1·4508, respectively, at a standard temperature of 50°. The portion of the original calculations which include the distances of deflection as a function have accordingly been recalculated, using the new distances, the numerical values of which having been in each case made to correspond to the actual distance by multiplying the observed distance by $1 + \cdot00001(t^{\circ} - 50^{\circ})$, t° being the observed temperature, and $\cdot00001$ the coefficient of expansion of the tube.

The series of deflections, as far as Dec. 1851, was formed into five groups, and the coefficient P. calculated for each group by means of the formula for two distances. The results were found as follows:—

| | | |
|---------------|-----|------------|
| From group 1, | P = | − ·00516 |
| , , | 2, | = − ·00160 |
| , , | 3, | = − ·00279 |
| , , | 4, | = − ·00470 |
| , , | 5, | = − ·00559 |

The mean of these gives P = − ·00395, which is the value employed in the calculations.

The Log. value of $\pi^2 K$ used throughout is 1·6558266.

The bifilar magnetometer was observed at short regular intervals during the progress of the two parts of the experiment, and the observations of deflection and vibration reduced to a uniform reading, that reading being the mean reading for the day of observation. The monthly mean results, which correspond in the first instance to the mean bifilar reading of the three days on which the observations were made, have in the final columns been reduced to the mean bifilar reading for the month in which the observations were made.

MONTHLY DETERMINATION OF THE DECLINATION WITH A PORTABLE DECLINOMETER.

The Description of the Declinometer with which these Determinations were made, and of the mode of its employment, is given in the Abstracts, Adjustments, and Comments prefixed to this Volume, page iii. The Declination is West.
