MAGNETICAL INSTRUMENTS.

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

MAGNETIC DECLINATION.

Absolute Values.—In January 1845 a series of Observations was commenced at Toronto, for the purpose of determining the monthly values of the Declination by means of a Declinometer, placed in a detached building appropriated to that object only. The Declinometer was of the construction described in Captain Riddell's "Magnetical Instructions," page 15, having a collimator magnet of 3·85 inches in length. The Theodolite employed to measure the angle between the zero of the collimator scale and a fixed distant object (the west side of the lighthouse in the harbour of Toronto, distant 3½ miles nearly from the Observatory) was the original transit theodolite of the Observatory; it was placed in the same building with the Declinometer, but on a separate pedestal. The building was of wood, copper fastened, and was situated in the Observatory enclosure about 20 feet S.W. of the Observatory itself. Usually six determinations were made in each month, and at about the same part of the month. The centre wire of the telescope was made to coincide with the zero of the collimator scale at an instant previously arranged, so that an assistant might at the same instant note the scale reading of the Declinometer in the Observatory; by this means each independent determination became referable to the mean reading of the last-named instrument, *i.e.*, of the differential Declinometer, in the same month.

The astronomical bearing of the west side of the lighthouse from the Theodolite was ascertained by the mean of 16 determinations made at intervals in 1845, 1846, and 1847, to be S. 8° 36' 7" E.

The Declinometer Observations from January 1845 to December 1851 inclusive are given in detail in the latter part of this volume. An abstract of them is contained in the following Table:—

TABLE I.—*Monthly Determinations of the Declination from 1845 to 1851, inclusive.*

| DATES. | Mean Observed Declination. | Mean Reading of the Observatory Declinometer. | Mean Monthly Reading of the Observatory Declinometer. | Differences $\alpha - \beta$. | | Observed Declination reduced to the Mean Monthly Reading of the Observatory Declinometer. | |

Secular Change.—The monthly determinations in Table I. furnish 84 equations of the form $\psi = \psi' + ay$, in which ψ is the most probable value of the Declination at the mean epoch July 1, 1848; ψ' the observed Declination in any other month; a the interval in months between the date of ψ' and July 1, 1848, negative if that date is earlier than July 1, 1848, positive if later; and y is the monthly secular change. From these equations are obtained $\psi = 1^\circ 34' 91$, the Declination at the mean epoch, July 1, 1848; and $y = 0' 1627$, or $12y = 1' 952$, the mean annual increase of West Declination in the years 1845 to 1851 inclusive.

Probable Error of the Monthly Determinations in Table I.—From the 84 equations furnished by Table I. we derive $\psi_1 = 1^\circ 34' 9 + 0' 1627a_1$, $\psi_2 = 1^\circ 34' 9 + 0' 1627a_2$, . . . $\psi_{84} = 1^\circ 34' 9 + 0' 1627a_{84}$ as the most probable values of the Declination in the several months from January 1845 to December 1851. From the differences between these, and the values actually observed in those months, we obtain by the known method $\pm 0' 75$ as the probable error of a single monthly determination; and $\pm 0' 08$ as the probable error of the mean determination $1^\circ 34' 9$ on July 1, 1848, assuming the true bearing of the west side of the lighthouse from the Theodolite to have been S. $8^\circ 36' 07''$ E., according to Captain Lefroy's determination. The "probable errors" include the irregularities produced by the magnetic disturbances. The differences from which the probable errors have been computed include the effects of the mean annual variation; these have not been eliminated because, as will presently be seen, they are so small that they may practically be disregarded.

Annual Variation.—The hourly observations of the differential declinometer during those years in which its indications can be shown to have been intercomparable, furnish the most unexceptionable means for this investigation. In the first vol. of the Toronto Observations, p. viii., the zero of the scale of the differential declinometer, or the division of the scale corresponding to the magnetic axis of its magnet, is stated to have been $143' 4$, as determined by Captain Younghusband on 4th June 1841. A redetermination by Captain Lefroy, in February 1849, before the declinometer was dismounted to make room for the self-recording instruments, gave also $143' 4$. The declination corresponding to the scale division $143' 4$ is given, for each month of the years 1845, 1846, and 1847, by the intercomparison of the mean monthly readings of the declinometer shown in Table I., with the most probable values of the declination corresponding to the same periods, derivable from the independent monthly determinations in the same Table by the general equation, $\psi' = 1^\circ 34' 9 + 0' 1627 a'$. The declination corresponding to the division $143' 4$, in the different months thus obtained, is shown in the following Table:—

TABLE II.

| MONTHS. | 1845 | 1846 | 1847 | Means | Differences | |
|----------------|--------|---------|---------|------------|-------------|--|
| | 1°+ | 1°+ | 1°+ | 1°+ | α - β | |
| January . . . | 9° 41' | 9° 46' | 10° 93' | 9° 94 = α | + 0° 71' | |
| February . . . | 9° 72' | 8° 86' | 9° 45' | 9° 34 = α | + 0° 11' | |
| March . . . | 9° 66' | 8° 74' | 8° 67' | 9° 02 = α | - 0° 21' | |
| April . . . | 9° 18' | 8° 47' | 8° 47' | 8° 71 = α | - 0° 52' | |
| May . . . | 9° 05' | 8° 27' | 8° 92' | 8° 75 = α | - 0° 48' | |
| June . . . | 9° 00' | 9° 22' | 9° 09' | 9° 10 = α | - 0° 13' | |
| July . . . | 8° 88' | 9° 53' | 9° 61' | 9° 34 = α | + 0° 11' | |
| August . . . | 8° 39' | 9° 26' | 9° 91' | 9° 19 = α | - 0° 04' | |
| September . . | 7° 83' | 8° 92' | 9° 15' | 8° 63 = α | - 0° 60' | |
| October . . . | 7° 92' | 9° 73' | 10° 24' | 9° 30 = α | + 0° 07' | |
| November . . . | 8° 02' | 9° 68' | 10° 33' | 9° 34 = α | + 0° 11' | |
| December . . . | 9° 11' | 10° 70' | 10° 35' | 10° 05 = α | + 0° 82' | |
| Means . . . | 8° 85' | 9° 24' | 9° 59' | 9° 23 = β | — | |

We may derive two conclusions from this Table : 1st, that the scale division corresponding to the magnetic axis of the declinometer magnet underwent little if any change during the years 1845, 1846, and 1847, and consequently that the indications of that instrument may be regarded as intercomparable in those years ; and, 2nd, that the *mean annual variation*, or that which is obtained by comparing the mean monthly readings with each other, can only be of very small amount. Of the two elements of comparison from which the values in Table II. are derived, one, viz., the most probable monthly values of the declination, is unaffected by the irregularities of the magnetic disturbances ; whilst the other, viz., the mean monthly readings of the declinometer, necessarily includes them. The small differences in the declination values in the three first columns of Table II. are probably, for the most part, occasioned by those irregularities ; and the differences in the final column may not be altogether uninfluenced by them.

We may also take from Table II. $1^{\circ} 09' \cdot 2$ as the declination value corresponding to the 143° 4 division of the declination scale during the years 1845, 1846, and 1847.

Annual Variation at the different Observation Hours.—Having shown that the observations of the differential declinometer were intercomparable during the years 1845 to 1847, and that the zero of the scale corresponded to $1^{\circ} 09' \cdot 2$ of west declination, we may combine the observations in the different months and at the different hours in those years so as to form a *mean year* corresponding to the middle year (January to December 1846). This is done in Table III., the values inserted in this Table being in every case a mean of the declinations observed at the specified hour and in the specified month in the three years commencing 1st January 1845 and ending 31st December 1847 :—

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

| | Corrections to be applied for Secular Change to reduce to the Mean Epoch, July 1st, 1846. | | | | | | | | | | | | |
| | +0° 90' | +0° 73' | +0° 57' | +0° 41' | +0° 24' | +0° 08' | -0° 08' | -0° 24' | -0° 41' | -0° 57' | -0° 73' | -0° 90' | |

The values in the vertical column on the extreme right of this Table show the mean declination at the different hours corresponding to the mean epoch of the Table, July 1, 1846; they are the values which would have been obtained in each case had the observations been limited to a single hour only. The values which are placed respectively on the same horizontal line with the mean declination at each of the hours show the mean declination at the same hour *in each month*. When corrections for the secular change have been applied to these, and the differences are taken between the *mean monthly values so corrected* and the *mean values in the twelve months* at the same hours (in the vertical column on the extreme right), we have in these differences the *Annual Variation at each of the observation hours*, as it would have been observed if the observations in each case had been limited to that particular hour, and if the declination at Toronto had had a constant value instead of being affected by secular change. They are shown in Table IV.

Annual Variation of the Declination at each of the 24 Observation hours derived from three Years of observation.

Scale. One inch to one minute of Arc. The dotted horizontal line represents the mean Declination at each hour as obtained from Observations throughout the three years at that hour only.

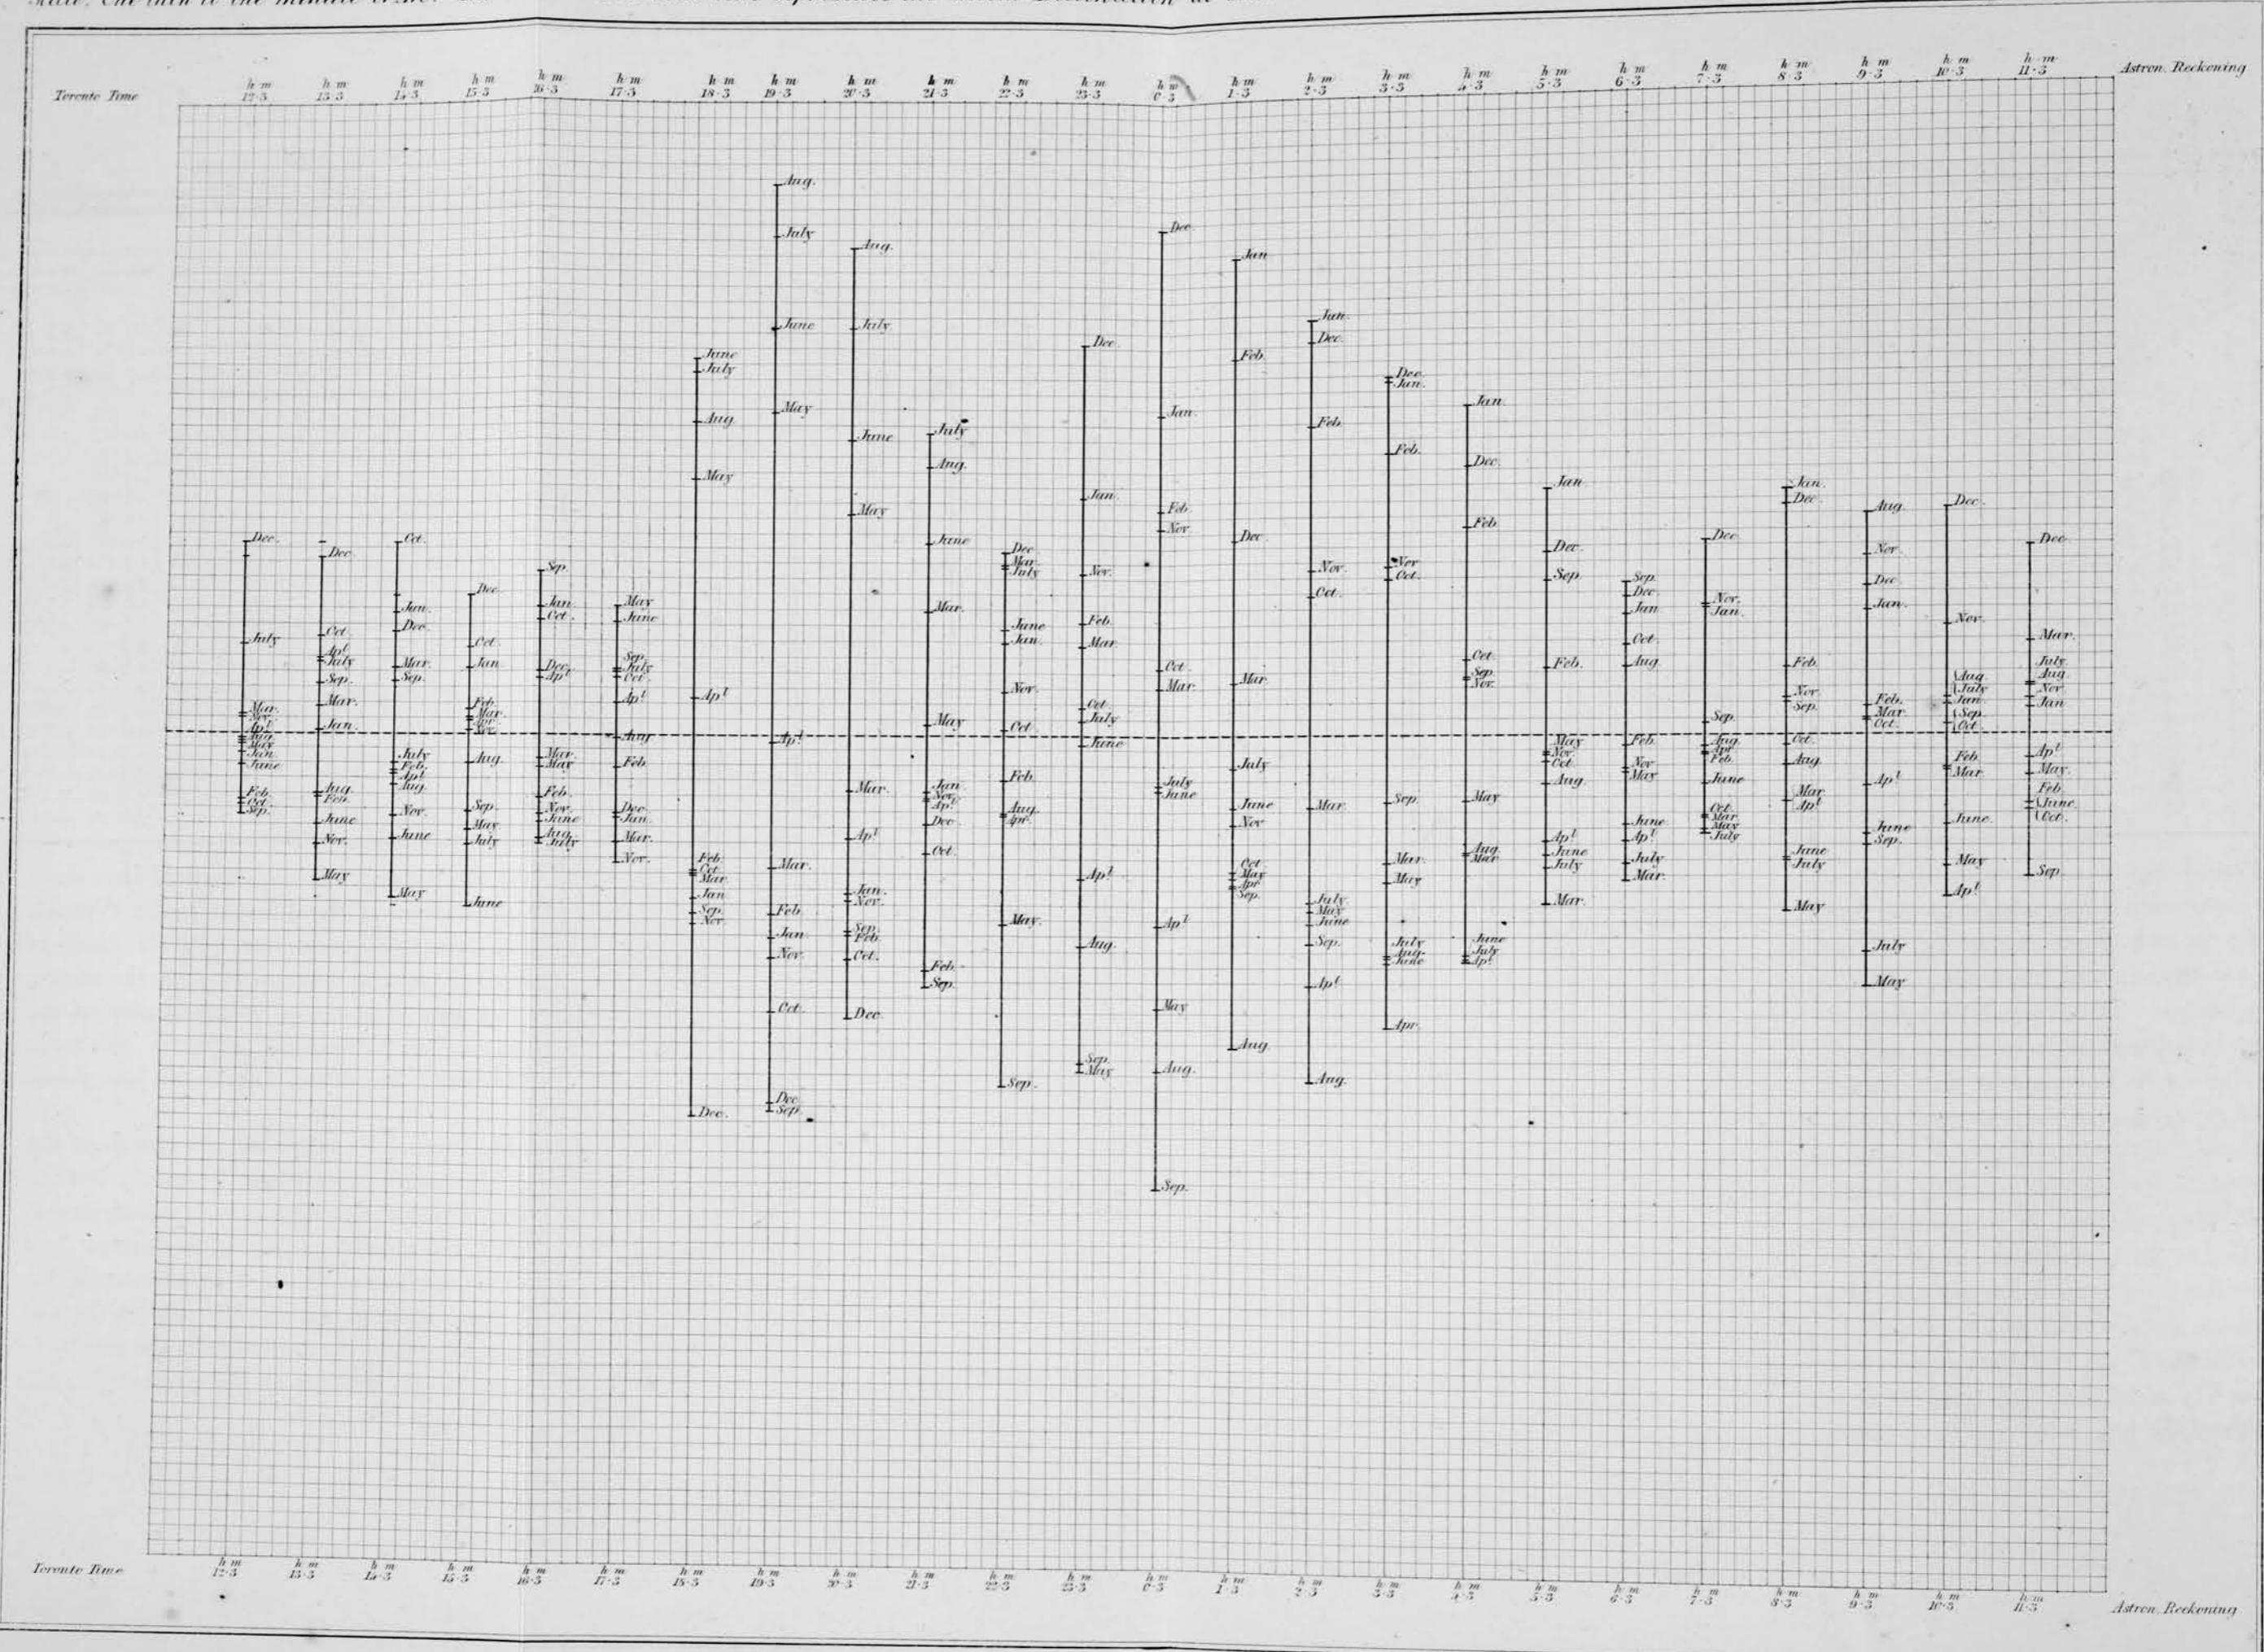

TABLE IV.

Annual Variation of the Declination at each of the Observation Hours.

+ denotes the North end of the needle being to the East, and - to the West of its mean or normal position in the year at the specified hour.

Plate I. has been drawn in illustration of this Table. The dark vertical lines show the comparative magnitude of the Annual Variation at the different hours, the scale being an inch to one minute of declination: the small cross lines with the names of the months annexed mark the position which the several months occupy in the respective ranges. The Annual Variation at each hour is projected independently of the other hours, and with reference only to its own mean or normal point, viz., the mean declination in the year at that particular hour: the dotted horizontal line passes through and marks these normal points.

Diurnal Variation.—Table V. exhibits the Diurnal Variation in each month of the year derived from the monthly means of the hourly observations from July 1842 to June 1848 inclusive; in computing the mean Diurnal Variation in each month corresponding to the observations of all these years, the months of August, September, and December 1847, and February and May 1848, have been omitted on account of the excessive disturbances which prevailed in those months. Table VI. exhibits in one view the mean Diurnal Variation in each month of the year derived from the results in Table V.; and Table VII. exhibits the mean hourly position of the magnet in each month of the year relatively to its mean position in that month.

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

TABLE V.

Diurnal Variation of the Declination in the several Months, from July 1842 to June 1848, inclusive.

The lowest Monthly Mean occurring at any observation hour is taken as the Zero for the

Corrections to Monthly Mean Values for the different Observation Hours.—Table VII. furnishes corrections to be applied in each month to the Mean of the Observations taken at Toronto at any one of the observation hours in that month. By this table the Mean Declination, as it would have been obtained (according to the results of six years of hourly observation) by twenty-four observations at equal intervals in each day, may be assigned for the Mean of Observations taken at one only of the observation hours. The Declinations being West, the corrections must be applied with the same signs as those in the Table.

Remarks on the Annual and Diurnal Variations.—It is well known that in the middle latitudes, geographical and magnetical, of both hemispheres, the north end of the magnet, in its mean diurnal course, has its extreme east and west positions about the hours of 7 or 8 A.M. and of 1 or 2 P.M.; having in the northern hemisphere its eastern extreme at the earlier hour, and its western extreme at the later hour, and in the southern hemisphere conversely, its western extreme at the earlier or forenoon hour, and its eastern at the later or afternoon hour. The Abstracts in the first volumes of the Toronto and Hobarton Observations respectively, have shown that the mean diurnal variation at those stations is in conformity with this law; the precise epoch of both extremes is somewhat earlier at Toronto than at Hobarton; but passing by for the moment this small difference, we may state in general terms that the principal features of the mean diurnal variation at Toronto and Hobarton consist in the north end of the magnet being at about 7 or 8 A.M. at its greatest eastern extreme at Toronto and western at Hobarton, and at about 1 or 2 P.M. its greatest western extreme at Toronto and eastern at Hobarton; the north end of the magnet being thus at opposite extremes of its diurnal course at the same hours of local time in opposite hemispheres. Let us now direct our attention to the *Annual Variations* at these hours respectively, taking first the forenoon period, or 7 to 8 A.M.

We find at Toronto at this hour an annual variation, of which the principal feature is, that at the northern solstice the north end of the magnet is at the eastern extreme of a periodical movement, which, apart from, and independently of, all other movements whatsoever, has its opposite or western extreme at the period of the southern solstice, and returns into itself at the next return of the northern solstice. It is, therefore, strictly an *Annual Variation*, or a variation whose period is a year. Its amount at the hour of 7 to 8 A.M. is at Toronto about five minutes of Declination.

If now we turn our attention to Hobarton at the same hour of local time, we find an Annual variation existing there also, which in character and amount is almost precisely the same as that which has been described at Toronto. In the mean *Diurnal Variation* at these stations, as already mentioned, 7 or 8 A.M. is the local hour for the extreme *easterly* elongation at Toronto, and *westerly* at Hobarton; but such inversion does not take place in the *Annual Variation*. On the contrary, at Hobarton as well as at

Toronto, the period of the northern solstice is that of the eastern extreme in the annual variation which the north end of the magnet undergoes, whilst the southern solstice is in like manner at both stations the period of the western extreme of the annual variation.

If from Toronto and Hobarton we pass to the consideration of the phenomena at St. Helena, a station differing widely, both geographically and magnetically, from either of the others, and, as situated within the tropics, partaking but very slightly in those climatic peculiarities of *season* by which extra-tropical stations are affected, we find at the same hour of 7 to 8 A.M. an annual variation almost precisely similar in character and amount to the phenomena described at Toronto and Hobarton. The northern solstice is here also the epoch of greatest eastern elongation, and the southern solstice that of greatest western elongation in the annual variation which the direction of the north end of the magnet undergoes. The amount of the periodical movement is also about five minutes of declination.

The Cape of Good Hope presents likewise at the same hour phenomena of annual variation which are almost precisely similar to those described at the three preceding stations. A plate has been engraved in the Philosophical Transactions for 1851, Art. XXVIII., in which this accordant annual variation at the four stations can be examined in greater detail than it is here described.

So far, then, as these four stations, so widely separated from each other, and so diversely situated, justify a generalisation, we may arrive at the conclusion that at the local hour of 7 to 8 A.M. the magnetic declination is *everywhere* subject to a variation of which the period is a year, and which is everywhere similar in character and amount, consisting of a movement of the north end of the magnet from east to west between the northern and the southern solstice, and a return from west to east between the southern and northern solstice, the amplitude of the variation being about 5 minutes of arc.

Such is the first and leading view of the phenomena of the annual variation at the hour of 7 to 8 A.M.; they are, as we have seen, sensibly the same in character and numerical amount at all the stations which form the basis of the generalisation.

When we follow the annual variation (still at the same hour) into further details—into those, for example, which mark the *periods of the year* which are the turning periods of the variation—we find a no less remarkable accordance. The turning periods are not, as many might be disposed to anticipate, those months in which the temperature at the surface of our planet, or of the subsoil, or of the atmosphere (as far as we possess the means of judging of the temperature of the atmosphere) attains its maximum and minimum. Stations so diversely situated would indeed present in these respects thermic conditions of great variety; whereas uniformity in the epoch of the turning periods is a not less conspicuous feature in the annual variation than is

similarity in character and numerical value. At all the stations the *solstices* are the turning periods of the annual variation at the hour of which we are treating. At each of the four stations we find the two months which precede and the two months which follow the northern solstice congregated together near one extremity of the annual range, whilst the two months which precede and the two which follow the southern solstice, are in like manner congregated near the other extremity of the range, the intermediate months ranging intermediately; whilst from the observations at St. Helena and the Cape of Good Hope, where, by reason of the diminished occurrence and amount of the so-called irregular disturbances, we are able from observations of a definite duration to obtain a more precise insight into the march of the phenomena, we find that we can trace the epoch of the passage through the mean position (or the position which is a mean between the extremes of the annual variation) almost to the very day of the equinox.

If then we permit ourselves to imagine the annual variation at 7 or 8 A.M. to be represented, as it is represented in Plate I., by a dark vertical line of about five inches in length, corresponding to the same number of minutes of declination, and if we further imagine this line, having the several months marked upon it in their respective places, to be incapable of inversion, but capable of being moved upwards and downwards in a vertical direction, so that at one station it may be altogether *above* a horizontal line indicating the mean declination, or mean position of the north end of the magnet in all the months and at all the hours, whilst at a second station at the same hour it may be altogether *below* a mean declination line, and at a third and fourth station it may be intersected in its length by the mean declination line, we at once figure to ourselves the combined phenomena of the annual and diurnal variations at Toronto, Hobarton, St. Helena, and the Cape at the hour of 7 to 8 A.M., local time, at each of the stations. At Toronto, in the northern hemisphere, the vertical line of annual variation is in its whole length *above*, or to the *east** of the horizontal line which marks the mean declination; so that in every month of the year the declination at the hour of 7 to 8 A.M. is to the east of the mean declination at all the hours and in all the months. At Hobarton, in the southern hemisphere, the vertical line of the annual variation is, on the other hand, in its whole length *below*, or to the *west* of the horizontal line which marks the mean declination; so that in every month of the year the declination at the hour of 7 to 8 A.M. is to the west of the mean declination. At St. Helena and the Cape, which in one sense at least may be classed together as magnetically equatorial stations, the position of the vertical line of annual variation, in reference to that of the line of mean declination, is nearly midway between the extreme positions which it occupies at Toronto and Hobarton. It is

* In the plates in these volumes illustrating the periodical variations of the declination, the upper part of the plate always represents the East, and the lower the West.

crossed and nearly bisected by the line of mean declination, so that at St. Helena and the Cape, during the months when the sun is north of the equator, the direction of the north end of the magnet is to the *east*, and during the months when he is to the south of the equator, to the *west* of the line of mean declination.

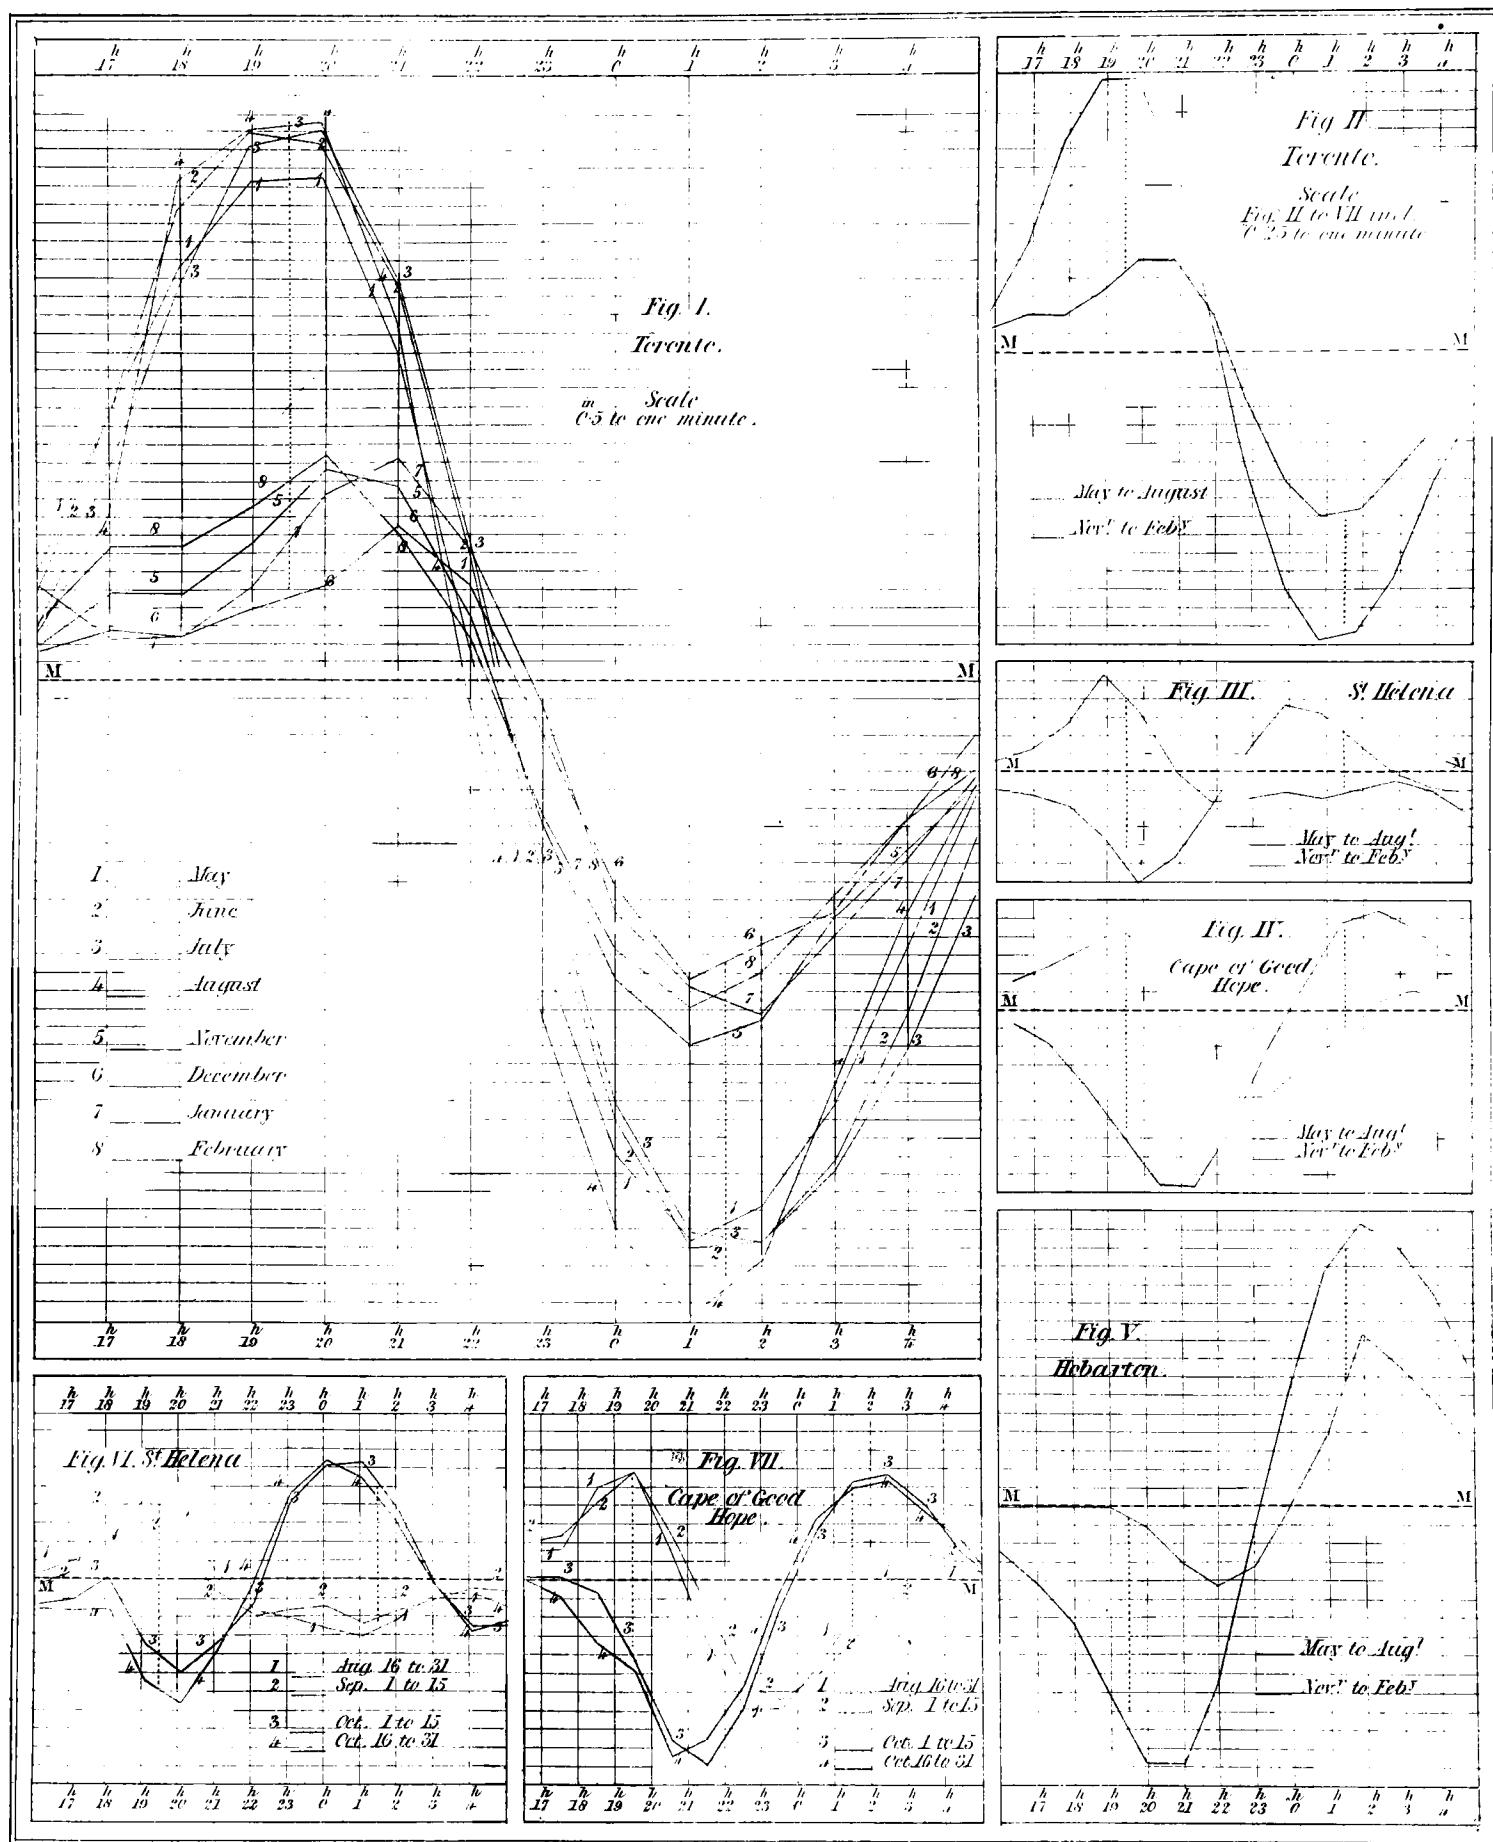

It is the existence of an annual variation everywhere of some minutes in amount, which chiefly prevents the realization in nature of the *à priori* supposition, that the horary variation, or the horary departure of the direction of the magnet from its mean direction in the 24 hours, would vanish in the equatorial regions, or in passing from the northern to the southern magnetic hemisphere. It is indeed possible (not at all hours, but still keeping to the hour of 7 to 8 A.M., as compared with the mean declination at all the hours and in all the months), so to group the phenomena as to afford *on the mean of the whole year* an apparent realization of the above supposition ; but it would be merely apparent and illusive, having no true conformity with the reasonings on which such a supposition was propounded by the eminent persons by whom it was not unnaturally entertained previous to the evidence which a complete system of observation, such as we now possess, was alone adequate to afford. Such an illusory disappearance at St. Helena of the horary variation would be obtained by combining the opposite variations at 7 or 8 A.M. of the two six-monthly periods into a mean, in which the opposite signs by which they are characterized in the different months would nearly counterbalance each other in their sum. But the only periods of the year in which the diurnal or horary variation at that hour does actually disappear are at the equinoxes, when the sun is passing from the one hemisphere to the other, and when the magnetic direction, in the course of its annual variation from east to west, or *vice versa*, coincides with the direction which is the mean declination of all the months and of all the hours.

If we now direct our attention to the hour of 1 to 2 P.M., the hour at which the north end of the magnet is at the *western* extreme of its *diurnal* range at Toronto, and at the *eastern* extreme at Hobarton, we find that at this hour also there is in the *annual* variation no inversion in the opposite hemispheres. The months adjacent to the one solstice are near one and the same extreme of the annual range at Toronto and Hobarton ; and the months adjacent to the other solstice are near the opposite extreme alike at both these stations. The order of the months in the annual range is indeed different at 1 to 2 P.M. from what it was at 7 to 8 A.M., the deflection being at 1 to 2 P.M. to the west at the northern solstice, and to the east at the southern solstice. But the point under present consideration is the comparison of the two stations at one and the same hour ; and in this respect we find the phenomena shown by the annual and diurnal variations at 1 to 2 P.M. analogous to that which has been described at 7 to 8 A.M. in presenting an opposite deflection at Toronto and Hobarton in the diurnal variation, and a similar deflection in the annual variation. The annual variation is obviously connected with, and dependent on, the earth's position in its orbit relatively

to the sun around which it revolves, as the diurnal variation is connected with and dependent on the rotation of the earth on its axis, by which each meridian successively passes through every angle of inclination to the sun in the round of 24 hours.

The seven figures in Plate II. have been drawn to illustrate the principal points of this discussion. In fig. 1 the combined annual and diurnal variations at Toronto are represented during the hours of the day, being the hours when the phenomena of both are most marked. The red lines show the actual march of the declination in the months of May, June, July and August, relatively to the mean declination in all the months and all the hours represented by the horizontal line M M, and are projected from the data in Table VII.; the blue lines show in like manner the march of the declination in the months of November, December, January and February, at the respective hours relatively to the same line, and taken from the same table. It is here seen that the months of May, June, July and August,—being the two months immediately preceding and the two months immediately following the northern solstice,—are almost identical with each other, and can scarcely be distinguished apart; whilst on the other hand, November, December, January, and February—the two months immediately preceding and the two months immediately following the southern solstice—differ greatly from the former, but closely resemble each other. The slightly darkened portions of the verticals at each hour show the annual variation at the several hours. The positions which the months intermediate between the two solstitial groups hold in the annual range are omitted in this plate, to avoid the multiplicity of lines, but they may be referred to in the corresponding projections in Plate I. As a consequence of the *diurnal* variation, the annual variations in the hours of the forenoon are found at Toronto, when exhibited in their true declination values, *above*, or to the *east* of the line M M, and in the hours of the afternoon, *below*, or to the *west* of the same line. The scale in this figure is half an inch to one minute of declination. In fig. 2 the phenomena at Toronto are again represented, but in smaller dimension, for the purpose of being seen in comparison with the corresponding phenomena at St. Helena, the Cape, and Hobarton, severally exhibited in figs. 3, 4, and 5. In figs. 2, 3, 4, and 5 the two solstitial groups in each figure are represented by a single line, their components being, in fact, scarcely separable on so small a scale. The group of the northern solstice is in each figure characterised by the red colour, and the southern solstitial group by blue. It is seen that at the hour of 7 to 8 A.M. (19^{h} to 20^{h}) the red lines are uppermost at all the stations, and the annual variation at that hour shown by the dotted verticals is everywhere nearly of the same amount. At 1 to 2 P.M. the blue line is in like manner uppermost at all the stations, and the dotted verticals vary but little in magnitude. At 7 to 8 A.M. (19^{h} to 20^{h}) the dotted vertical showing the annual variation is, at Toronto, in its whole length above, or to the east of the line of mean declination M M; at St. Helena and the Cape it is crossed and nearly bisected by that line, and at Hobarton it is in its whole length below, or to the west of M M. At

Illustrations of the Annual and Diurnal Variations of the Declination.

Toronto 7 to 8 A.M. is the hour at which the north end of the magnet, in its diurnal range, is in all the months of the year at the extreme east of its diurnal range, whilst at Hobarton, at the same hour (or nearly so, rather later at Hobarton), it is at the extreme west of its diurnal range; but at both stations the northern solstitial group is at the eastern, and the southern solstitial group at the western extreme of the annual range. At 1 to 2 P.M. the analogy of the phenomena of the annual and diurnal variation is maintained, but all is in the converse order.

Figures 6 and 7 are introduced for the purpose of showing the precise epoch when the diurnal variation undergoes that portion of its semi-annual change which is due to the annual variation. They represent respectively the phenomena at St. Helena and at the Cape of Good Hope. The two projections which are coloured red in each figure exhibit the diurnal variations in the two fortnights which precede the September equinox, and the two projections coloured blue the two fortnights which follow the equinox. The projections preceding the equinox correspond with each other in the character of their diurnal variation, as do the fortnights following the equinox; but the two fortnights which precede are altogether distinct in character from the two which follow the equinox; a distinction which is due to the change in the annual variation which is there seen to take place precisely at the equinox itself. The last fortnight in August and the first fortnight in September are scarcely distinguishable from the northern solstitial group (May to August, inclusive) in figs. 3 and 4; and the two fortnights in October are in like manner scarcely distinguishable from the southern solstitial group (November to February, inclusive) in the same figures. The epoch of change is coincident with the sun's passage of the Equator.

Variation of the Diurnal Range.—Table VIII. shows the inequality, or variation in the amount, of the mean diurnal range of the declination in different years, and in different seasons of those years. The general tables, in which the observations of the declination are recorded, exhibit the mean diurnal variation for every month; the extreme east and west positions of the magnet occurring at any two hours in the monthly means indicate the average magnitude, or the range, of the diurnal variation in that month. Table VIII. shows the means of the average magnitudes or ranges in the four months constituting the respective seasons, and in the twelve months constituting the year, from 1841 to 1851, inclusive. It will be remembered that up to the end of June, 1842, the observations were made only at the even hours of Göttingen time, which were also even hours of Toronto time; and that from July 1842 to June 1848, inclusive, they were made hourly. From July 1848 to December 1851 the number of observation hours was much reduced, and was occasionally varied; but they were always arranged with a view to include, as far as could conveniently be done, the hours of maximum and minimum declination depending upon the diurnal variation.

TABLE VIII.

Mean Magnitude of the Diurnal Range of the Declination from 1841 to 1851 inclusive.

| YEARS. | Winter. | Spring and Autumn. | Summer. | Mean of the whole Year. | YEARS. |

| 1851 | 7·01 | 10·82 | 12·61 | 10·15 | 1851 |

Analysis of the larger Disturbances of the Declination.—For the purpose of investigating the laws which regulate the occurrence of the class of magnetic disturbances of the declination which are called in the Royal Society's Instructions the "Irregular Variations," all the observations taken in the seven and a-half years from January 1841 to July 1848 inclusive (two-hourly to June 30th, 1842, and hourly from July 1st, 1842, to June 30th, 1848), which differed to an amount of five scale divisions, or 3·6 of declination, from the mean or normal position of the magnet in the same month and at the same hour, were separated from the remainder of the observations, and have been submitted to an examination of which the results are contained in the following pages. The number of observations thus separated amounted in the seven and a-half years to 5,322; the number of observations from which they were taken was, in the same period, 50,097; the disturbed observations consequently averaged 1 in 9·4 of the whole number. The ratio in different years varied considerably, as will be seen by the following Table:—

TABLE IX.

| YEARS. | Number of Observations. | Number of Disturbed Observations. | Ratio of the Disturbed Observations to the whole number. | YEARS. | Number of Observations. | Number of Disturbed Observations. | Ratio of the Disturbed Observations to the whole number. |
|--------|-------------------------|-----------------------------------|--|--------|-------------------------|-----------------------------------|--|
| 1841 | 3,606 | 570 | 1 : 6·3 | 1845 | 7,455 | 567 | 1 : 13·1 |
| 1842 | 5,635 | 606 | 1 : 9·3 | 1846 | 7,464 | 1,031 | 1 : 7·2 |
| 1843 | 7,463 | 472 | 1 : 15·8 | 1847 | 7,272 | 941 | 1 : 7·7 |
| 1844 | 7,482 | 596 | 1 : 12·6 | 1848 | 3,720 | 538 | 1 : 6·9 |

The column of ratios shows that 1843, 1844, and 1845, were years in which the proportion of observations affected by a certain amount of disturbance was much

smaller than the preceding years 1841 and 1842, or than the following years 1846, 1847, and 1848.

Table X. shows the aggregate values of the disturbed observations in the different years in scale divisions, one scale division = $0' \cdot 721$ of declination. The values in this Table respectively divided by the numbers in Table IX. show the *average value* of a disturbed observation in each of the years. It is seen by this Table that the average values were, generally speaking, highest in the years when the number of observations affected by a certain definite amount of disturbance was greatest; 1844 is the most marked exception.

TABLE X.
Aggregate Values and Average Values of the Disturbed Observations in the different Years.

| YEARS. | Aggregate Value of the Disturbed Observations. | | YEARS. | Aggregate Value of the Disturbed Observations. | |
|--------|---|----------|--------|---|----------|
| | Sc. Div. | Sc. Div. | | Sc. Div. | Sc. Div. |
| 1841 | 5013·5 | 8·8 | 1845 | 4584·6 | 8·1 |
| 1842 | 4951·5 | 8·2 | 1846 | 9231·4 | 8·9 |
| 1843 | 3671·8 | 7·8 | 1847 | 10296·3 | 10·9 |
| 1844 | 5345·9 | 9·0 | 1848 | 5261·4 | 9·8 |

Table XI. exhibits the disturbed observations in different years, divided into their easterly and westerly components, both of numbers and aggregate values; as well as the average value of an easterly and of a westerly disturbance in each year.

| YEARS. | EASTERLY. | | WESTERLY. | | AVERAGE VALUES. | | YEARS. |
|--------|-----------|---------|-----------|---------|-----------------|-----------|--------|
| | Numbers. | Values. | Numbers. | Values. | Easterly. | Westerly. | |
| | | | | | Sc. Div. | Sc. Div. | |
| 1841 | 282 | 2586·4 | 288 | 2427·1 | 9·2 | 8·4 | 1841 |
| 1842 | 327 | 2700·8 | 279 | 2250·7 | 8·3 | 8·1 | 1842 |
| 1843 | 268 | 2100·6 | 204 | 1571·2 | 7·8 | 7·7 | 1843 |
| 1844 | 327 | 2999·1 | 269 | 2346·8 | 9·2 | 8·7 | 1844 |
| 1845 | 298 | 2442·8 | 269 | 2141·8 | 8·2 | 8·0 | 1845 |
| 1846 | 547 | 5068·7 | 484 | 4162·7 | 9·3 | 8·6 | 1846 |
| 1847 | 532 | 5020·4 | 409 | 5275·9 | 9·4 | 12·9 | 1847 |
| 1848 | 288 | 3030·3 | 250 | 2231·1 | 10·5 | 8·9 | 1848 |
| Sums. | 2,871 | 25949·1 | 2,452 | 22407·3 | 71·9 | 71·3 | Sums. |

The average values of an easterly and a westerly disturbed observation appear, on the mean of the eight years, to be nearly equal. The average value of an easterly disturbance was somewhat higher than that of a westerly disturbance in all the years except 1847, when the average value of a westerly exceeded, by a considerable amount, that of an easterly disturbed observation.

The numbers and aggregate values of the easterly disturbances preponderate in the mean of all the years, as well as in each separate year, except 1841, when there was a slight excess in the number of westerly disturbances, and 1847, when there was a slight excess in the aggregate values of the westerly disturbances. The ratio of easterly to westerly numbers and values in the $7\frac{1}{2}$ years is, of numbers 1.17 to 1, and of values 1.16 to 1.

The numbers and aggregate values in Tables IX. and X. are not strictly intercomparable in the several years, because in 1841, and in the first six months of 1842, the observations were two-hourly, whilst in all the other years they were hourly, and in 1848 because the observations, although hourly, include only the first six months of that year. To render the whole intercomparable at once by the eye, the numbers and aggregate values in 1841 and 1848 require to be doubled, and those of 1842 to be augmented in the proportion of 4 to 3: this is done in Table XII.

TABLE XII.

| | YEARS. | Numbers. | Values. | YEARS. | Numbers. | Values. | |
|--|--------|----------|----------|--------|----------|----------|--|
| | | | Sc. Div. | | | Sc. Div. | |
| | 1841 | 1,140 | 10027.0 | 1845 | 567 | 4584.6 | |
| | 1842 | 808 | 6602.0 | 1846 | 1,031 | 9231.4 | |
| | 1843 | 472 | 3671.8 | 1847 | 941 | 10296.3 | |
| | 1844 | 596 | 5345.9 | 1848 | 1,076 | 10522.8 | |

1843 is the year of minimum and 1848 of maximum disturbance, both in numbers and values; and between those years there is an approximate progression. If we take the means of the numbers and of the values in the years 1843 to 1848, inclusive, as the respective units, we obtain the ratios of the numbers and aggregate values in the several years as follows:—

TABLE XIII.

| | Units . . . | Numbers. | Values. | Units . . . | Numbers. | Values. | |
|--------|-------------|----------|--------------------|-------------|----------|--------------------|------|
| | | 780.5 | Sc. Div. 7275.5 | | 780.5 | Sc. Div. 7275.5 | |
| Ratios | 1841 | 1.46 | 1.38 | Ratios | 1845 | 0.73 | 0.63 |
| | 1842 | 1.04 | 0.91 | | 1846 | 1.32 | 1.27 |
| | 1843 | 0.61 | 0.50 | | 1847 | 1.21 | 1.42 |
| | 1844 | 0.76 | 0.73 | | 1848 | 1.38 | 1.45 |

Tables XIV. and XV. show the numbers and aggregate values of the disturbed observations, distributed into the several *months* of their occurrence.

| September . . | 626·7 | 623·9 | 458·7 | 784·7 | 675·0 | 1480·9 | 1758·4 | — | 6408·3 |
| October . . | 417·8 | 458·1 | 297·3 | 547·2 | 436·7 | 1070·7 | 1220·0 | — | 4447·8 |
| November . . | 325·7 | 500·4 | 122·5 | 489·4 | 277·6 | 507·2 | 832·8 | — | 3055·6 |
| December . . | 326·9 | 122·7 | 125·4 | 308·3 | 361·8 | 186·9 | 1369·0 | — | 2801·0 |
| Sums . . | 5013·5 | 4951·5 | 3671·8 | 5345·9 | 4584·6 | 9231·4 | 10296·3 | 5261·4 | 48356·4 |

As the numbers and values in 1841, and in the first six months of 1842, in Tables XIV. and XV., are derived from two-hourly observations, the mean monthly numbers and values in the months from January to June, inclusive, are obtained by dividing the monthly sums by 7, and those from July to December, inclusive, by dividing the monthly sums by 6·5. The respective quotients are shown in Table XVI.

TABLE XVI.
Mean Monthly Numbers and Values of the Disturbed Observations.

| MONTHS. | Numbers. | Values. | MONTHS. | Numbers. | Values. |
|--------------|----------|----------|---------------|----------|----------|
| | Sc. Div. | Sc. Div. | | Sc. Div. | Sc. Div. |
| January . . | 39·6 | 334·0 | July . . | 88·3 | 749·1 |
| February . . | 52·9 | 497·7 | August . . | 89·1 | 767·1 |
| March . . | 61·4 | 560·0 | September . . | 100·6 | 985·9 |
| April . . | 75·6 | 739·4 | October . . | 69·7 | 684·3 |
| May . . | 66·7 | 560·6 | November . . | 51·8 | 470·1 |
| June . . | 55·7 | 421·0 | December . . | 40·3 | 430·9 |

If the mean of the twelve monthly numbers (66) and of the twelve monthly values (600·0 sc. div^{ns.}) are taken as units, the ratios in the several months are obtained as follows:—

TABLE XVII.

| MONTHS. | Numbers. | Values. | MONTHS. | Numbers. | Values. |
|--------------|----------|---------|-------------|----------|---------|
| January . . | 0·60 | 0·56 | July . . . | 1·34 | 1·25 |
| February . . | 0·80 | 0·83 | August . . | 1·35 | 1·28 |
| March . . . | 0·93 | 0·93 | September . | 1·53 | 1·64 |
| April . . . | 1·15 | 1·23 | October . . | 1·05 | 1·14 |
| May . . . | 1·00 | 0·93 | November . | 0·78 | 0·78 |
| June . . . | 0·84 | 0·70 | December . | 0·61 | 0·72 |

April and September are the months of maxima, December or January, and June those of minima, both in numbers and values. The September maximum is higher than the April maximum; and the December or January minimum is lower than the June minimum. The maxima occur about the time of the equinoxes; the minima about the solstices.

Table XVIII. exhibits the mean monthly numbers and aggregate values in the different months, separated into their easterly and westerly components.

TABLE XVIII.

| MONTHS. | EASTERLY. | | WESTERLY. | | MONTHS. | EASTERLY. | | WESTERLY. | |
|--------------|-----------|----------|-----------|---------|-------------|-----------|---------|-----------|---------|
| | Numbers. | Values. | Numbers. | Values. | | Numbers. | Values. | Numbers. | Values. |
| January . . | 19·6 | Sc. Div. | 20·0 | 158·2 | July . . . | 50·0 | 435·1 | 38·3 | 314·0 |
| February . . | 26·7 | 261·5 | 26·2 | 236·2 | August . . | 48·6 | 441·7 | 40·5 | 325·4 |
| March . . . | 32·8 | 313·4 | 28·6 | 246·6 | September . | 58·2 | 522·8 | 42·4 | 463·1 |
| April . . . | 40·9 | 394·2 | 34·7 | 345·2 | October . . | 36·0 | 359·7 | 33·7 | 324·6 |
| May . . . | 36·0 | 301·9 | 30·7 | 258·7 | November . | 25·8 | 226·5 | 26·0 | 243·6 |
| June . . . | 33·9 | 268·3 | 21·8 | 152·7 | December . | 18·3 | 159·4 | 22·0 | 271·5 |

If the means of the twelve monthly numbers (35·6 and 30·4) and of the twelve monthly values (321·7 and 278·3 sc. div^{ns.}) are taken as units, the ratios in the several months are obtained as follows:—

TABLE XIX.

| MONTHS. | EASTERLY. | | WESTERLY. | | MONTHS. | EASTERLY. | | WESTERLY. | |
|--------------|-----------|---------|-----------|---------|-------------|-----------|---------|-----------|---------|
| | Numbers. | Values. | Numbers. | Values. | | Numbers. | Values. | Numbers. | Values. |
| January . . | 0·55 | 0·55 | 0·66 | 0·57 | July . . . | 1·40 | 1·35 | 1·26 | 1·13 |
| February . . | 0·75 | 0·81 | 0·86 | 0·85 | August . . | 1·37 | 1·37 | 1·33 | 1·17 |
| March . . . | 0·92 | 0·97 | 0·94 | 0·89 | September . | 1·63 | 1·63 | 1·39 | 1·66 |
| April . . . | 1·15 | 1·23 | 1·14 | 1·24 | October . . | 1·01 | 1·12 | 1·11 | 1·17 |
| May . . . | 1·01 | 0·94 | 1·01 | 0·93 | November . | 0·73 | 0·70 | 0·85 | 0·88 |
| June . . . | 0·95 | 0·83 | 0·72 | 0·55 | December . | 0·51 | 0·50 | 0·72 | 0·98 |

It is seen by Table XIX. that both the easterly and the westerly disturbances follow the same general law as that derived from their conjoint consideration in the remarks on Table XVII.; the equinoxes are the epochs of maximum and the solstices of minimum, both of numbers and values.

Table XX. shows the ratios of the easterly to the westerly numbers and values of the disturbed observations, the westerly numbers and values in each month being taken as the units.

TABLE XX.
Ratios of Easterly to Westerly Disturbances in the several Months.

| MONTHS. | Numbers. | Values. | MONTHS. | Numbers. | Values. |
|----------------|----------|---------|---------------|----------|---------|
| January . . . | 0·98 | 1·11 | July . . . | 1·31 | 1·39 |
| February . . . | 1·02 | 1·11 | August . . . | 1·20 | 1·36 |
| March . . . | 1·15 | 1·27 | September . . | 1·37 | 1·13 |
| April . . . | 1·18 | 1·14 | October . . . | 1·07 | 1·11 |
| May . . . | 1·17 | 1·17 | November . . | 0·99 | 0·93 |
| June . . . | 1·56 | 1·76 | December . . | 0·83 | 0·59 |

The preponderance of easterly over westerly disturbances is greatest in June and least in December; generally speaking, there is a progressive increase in the numbers and values of easterly disturbances, compared with westerly, from December to June, and a progressive decrease from June to December. The mean ratios in the months of November, December, and January are in numbers 0·94, and in values 0·84; in the months of May, June, and July, in numbers 1·32, and in values 1·39.

The average value of a disturbed observation in each of the months is as follows:—

TABLE XXI.

| MONTHS. | Average Values. | MONTHS. | Average Values. |
|----------------|-----------------|---------------|-----------------|
| | Sc. Div. | | Sc. Div. |
| January . . . | 8·4 | July . . . | 8·5 |
| February . . . | 9·4 | August . . . | 8·6 |
| March . . . | 9·1 | September . . | 9·8 |
| April . . . | 9·8 | October . . . | 9·8 |
| May . . . | 8·4 | November . . | 9·1 |
| June . . . | 7·6 | December . . | 10·7 |

The average value of a disturbed observation is less in June than in the other months, and generally less in May, June, and July, than at other periods of the year.

The average values of the easterly and westerly constituents, viewed separately, show each a similar influence of the period of the year to that which is presented by them when viewed conjointly. The range of the average values of the easterly is considerably greater, and appears more irregular, than that of the westerly disturbed observations.

The numbers and values of the easterly and westerly constituents of the disturbed observations distributed into the *hours* of their respective occurrence are as follows:—

TABLE XXII.
Number of Easterly and of Westerly Disturbed Observations at the several Hours.

| Toronto Astron. Time. | EASTERLY. | | | | | | | | WESTERLY. | | | | | | | |

Tables XXII. and XXIII. comprise the disturbed observations occurring in the hourly series from July 1, 1842, to June 30, 1848; consequently in each of the years 1842 and 1848 the observations of six months only are included.

TABLE XXIII.
Aggregate Values of the Easterly and Westerly Disturbed Observations at the several Hours, in Scale Divisions.

When we examine the ratios presented in this table we at once perceive that the occurrence of easterly and westerly disturbances, and their distribution in the several hours, are regulated by different laws. The easterly are below the average both in number and value during the hours of the day, or from 6 A.M. to 6 P.M., and above the average during the hours of the night, or from 6 P.M. to 6 A.M.; whilst the westerly are below the average both in number and value from about noon to midnight, and above the average from midnight to noon. The easterly have a minimum both in number and value about 3 P.M., and a maximum about 9 P.M.; the westerly a minimum about 9 P.M. (at which hour the easterly have their maximum), and a minimum about 7 or 8 A.M. The hours from noon to 6 P.M. are those in which both easterly and westerly disturbances are below their respective averages, both in numbers and values: these are therefore the hours of least disturbance. From 6 A.M. to noon the deficiency, occasioned by the easterly being below their average in number and value, is in great part compensated by the higher ratios of the westerly disturbances at those hours. From 6 P.M. to midnight the westerly disturbances are below their average, but this deficiency of the westerly is much more than counterbalanced by the excess

of the easterly disturbances at these hours, which are consequently the hours of greatest disturbance.

The occasional differences between the ratios of the numbers and values at the same hours may doubtless be attributed in part to accidental irregularities, but they must also in great part be ascribed to systematic variations in the mean value of a disturbed observation at different hours. The following table shows the average values of the easterly and of the westerly disturbed observations at each hour obtained by dividing the aggregate values by the numbers.

TABLE XXV.
Showing the Average Value of an Easterly and of a Westerly Disturbed Observation at the several Hours, and the Ratios at each Hour to the Mean Value in the 24 Hours.

| | | | | | Mean Values in the 24 hours |

The average value of an easterly disturbed observation is systematically less during the hours of the day than during those of the night. It is less at *every* hour from 6 A.M. to 4 P.M., inclusive, than at *any* hour from 5 P.M. to 5 A.M.; it varies little in the day, but in the night hours has a tendency towards a maximum at 9 P.M. The average value of a westerly disturbed observation is less than its mean value in the 24 hours from 10 A.M. to 9 P.M., inclusive, and from 2 A.M. to 4 A.M., inclusive, it varies little at the hours from 11 A.M. to 11 P.M. (with the exception already noticed at

10 P.M.); it is about the same amount at those hours as the mean value of an easterly disturbed observation from 6 A.M. to 4 P.M. The value becomes very high from 6 to 9 A.M., inclusive, especially at 7 A.M.

In the case of the easterly disturbed observations there is a coincidence between the ratios of the aggregate values and the average values, both of which are low during the day and high during the night, the maximum of each occurring markedly at the same hour, 9 P.M. But in the case of the westerly disturbed observations, there does not appear to be any systematic connexion between the ratio of the aggregate values at the different hours and the average values at the same hours. The ratio of the numbers of the westerly disturbances is higher from 6 A.M. to 9 A.M., inclusive, when the mean values are also highest; but the ratio of the numbers is lowest at 10 P.M., when the mean value is high, and the ratio of the numbers is under unity at midnight and 1 A.M., when the mean values are systematically high.

The ratios of the numbers and values of the easterly to the westerly disturbed observations at the different hours are shown in the following table, in which the westerly numbers and values at the several hours are taken as the respective units.

TABLE XXVI.

| Toronto Astronomical Time. | Numbers. | Values. | Toronto Astronomical Time. | Numbers. | Values. |
|----------------------------------|----------|---------|----------------------------------|----------|---------|
| h. 18 | 0·94 | 0·56 | h. 6 | 1·18 | 1·64 |
| 19 | 0·88 | 0·37 | 7 | 1·90 | 2·38 |
| 20 | 0·70 | 0·40 | 8 | 2·78 | 3·96 |
| 21 | 0·70 | 0·44 | 9 | 4·00 | 6·30 |
| 22 | 0·70 | 0·53 | 10 | 4·28 | 4·37 |
| 23 | 0·82 | 0·72 | 11 | 3·00 | 3·98 |
| 0 | 0·67 | 0·57 | 12 | 2·45 | 2·30 |
| 1 | 0·77 | 0·77 | 13 | 1·79 | 1·58 |
| 2 | 0·64 | 0·58 | 14 | 1·11 | 1·32 |
| 3 | 0·50 | 0·50 | 15 | 1·12 | 1·28 |
| 4 | 0·53 | 0·66 | 16 | 1·00 | 1·15 |
| 5 | 0·69 | 0·77 | 17 | 1·06 | 0·77 |

We perceive by this table how greatly and systematically the ratios vary according to the hour; they have their maximum from 9 to 10 P.M., and their minimum in numbers in the early hours of the afternoon, and in values at the early hours of the forenoon, the difference between the numbers and values in this respect being caused by the very high mean value of a westerly disturbance at the early hours of the forenoon. Easterly disturbances preponderate greatly both in numbers and values from 7 P.M. to midnight. At 9 P.M. the ratio of the easterly to westerly values is about *ten times* as great as on the average of the hours of the day. By this preponderance the character of the mean diurnal variation of the declination, whose laws of maximum, minimum, and progression are ordinarily very different from those of the dis-

turbances which we are now examining, must be more or less influenced at all stations where disturbances have a sensible value; and in extreme cases, viz., where the mean diurnal variation occasioned by the disturbances becomes great in numerical value in proportion to the diurnal variation produced by the different class of phenomena on which it is superimposed, it must, to a greater or less degree, give the character to the combined result. For the purpose of exhibiting the character of this law the following table has been formed, showing the excess of easterly or westerly disturbance at the different hours caused by the 3940 disturbances of largest amount occurring in the five years commencing July 1st, 1843, and ending June 30th, 1848; the excess in each case being divided by 1552 (the number of days of observation in the five years), the quotients show the mean diurnal variation caused by the larger disturbances, or the systematic effect produced by them on the direction of the magnet at the different hours.

TABLE XXVII.
Mean Diurnal Variation occasioned by the 3940 Disturbances of largest Amount occurring between July 1, 1843, and June 30, 1848.

The mean diurnal variation of the declination at Toronto, caused by the disturbances from the mean or normal position of the magnet exceeding $3' \cdot 6$ in amount, has a principal westerly maximum a little after 7 A.M., and a principal easterly maximum a little after 9 P.M., the range of the diurnal affection amounting to $(0' \cdot 48 \text{ W.} + 0' \cdot 78 \text{ E.}) = 1' \cdot 26$. From the easterly maximum soon after 9 P.M., the easterly variation progressively and steadily diminishes, passing through the point of no "disturbance variation" between 4 and 5 A.M., and reaching the westerly maximum a little after 7 A.M. The direction of the movement is then changed towards the east, and the western variation diminishes (with a slight and possibly accidental irregularity about 11 A.M. or noon) to 1 P.M., when the direction is again changed towards the west, whereby a second or subordinate westerly maximum is occasioned about 3 P.M. From

this hour to the easterly maximum, a little after 9 P.M., the movement of the magnet towards the east due to the disturbances is continuous and increases from hour to hour, being considerably greater from 7 to 9 P.M., inclusive, than at any other part of the 24 hours. When it is considered that the influence of the larger disturbances on the direction of the declination magnet thus presented and described is a *mean daily effect* derived from *five years* of observation, and when its strikingly regular and systematic character is viewed, it appears to have strong claims to be received as the indication of a true natural law in respect to direction and turning hours. The numerical values would doubtless be considerably greater if the minor disturbances of the same class occurring in the same period of time could have been separated from the general body of the observations and had been taken into the account.

TABLE XXVIII.

Classification of the 3940 largest Disturbances in 5 Years (July 1, 1843, to June 30, 1848,) according to their Magnitudes.

| | NUMBERS. | | | VALUES. | | | RATIOS (Westerly to Easterly). | | Average Value of the Distur- bances. |

In the disturbances of largest magnitude—*i. e.*, in those which exceed $36'$ in amount—westerly deflections preponderate; in the disturbances of smaller amount easterly deflections preponderate. At Hobarton also, in the same period, the excess of westerly over easterly deflections (though existing throughout, and being in that respect different from Toronto,) was greatest in the disturbances of largest amount; in those of lesser amount, westerly deflections at Hobarton, and easterly at Toronto, preponderate in nearly equal ratios.

A comparison of Table XXVIII. with Table XXVI., pp. xxvii. to xxxvi. of the 2nd volume of the Hobarton Observations, containing a similar classification of the disturbances which occurred in the same five years at Hobarton, furnishes the means of examining the relative proportion in which disturbances of equal magnitude take place at the

two stations. If, for example, we compare the numbers and aggregate values of the disturbances which are of magnitudes between 20 and 10 scale divisions ($14' \cdot 2$ and $7' \cdot 1$ at Hobarton, and $14' \cdot 4$ and $7' \cdot 2$ at Toronto), we find the numbers to have been at Toronto 789, and the aggregate values $10353 \cdot 0$ scale divisions, whilst at Hobarton the numbers were 238, and the aggregate values $3115 \cdot 9$ scale divisions; the ratios both of numbers and of values being $3 \cdot 3$ to 1. A second comparison is furnished by the disturbances comprised between 10 and 7 scale divisions ($7' \cdot 2$ and $5' \cdot 0$ at Toronto, $7' \cdot 1$ and $5' \cdot 0$ at Hobarton), when we find the numbers at Toronto to be 1123, and the values $9233 \cdot 4$ sc. div^{ns}., whilst at Hobarton the numbers are 401, and the values $3255 \cdot 0$ sc. div^{ns}., the ratios of numbers and values being $2 \cdot 8$ to 1. A third comparison is furnished by the disturbances comprised between 7 and 5 scale divisions ($5' \cdot 0$ and $3' \cdot 6$ at both stations), when we find the numbers at Toronto to have been 1849, and the values $10752 \cdot 5$ sc. div^{ns}., and at Hobarton the numbers 838, and values $4825 \cdot 0$ sc. div^{ns}., the ratios of numbers and values being $2 \cdot 2$ to 1. Further, if we compare the numbers and aggregate values of all the disturbances above 5 scale divisions (or $3' \cdot 6$) which occurred in the five years at each of the stations, we find the numbers at Toronto 3940, and the aggregate values $36728 \cdot 6$ scale divisions, whilst at Hobarton the numbers are 1517, and the aggregate values $12262 \cdot 3$ scale divisions; the ratios being, of numbers, $2 \cdot 6$ at Toronto to 1 at Hobarton, and of values, $3 \cdot 0$ at Toronto to 1 at Hobarton. The greatest disturbance of the Declination recorded at Hobarton in the course of the hourly observations between July 1, 1843, and June 30, 1848, amounted to $35' \cdot 8$; it occurred on the 27th of September, 1847, at 0^{h} of Göttingen time (9^{h} of Hobarton time): the greatest disturbance recorded in the same period by the hourly series at Toronto amounted to $215' \cdot 8$; it occurred on the 24th of September, 1847, at 1^{h} of Göttingen time (7^{h} of Toronto time). Both were westerly deflections; and it may be stated generally that the disturbances of greatest amount were usually westerly deflections of the north end of the magnet, both at Toronto and Hobarton. The average value of each of the 3940 disturbances at Toronto, and of the 1517 disturbances at Hobarton, exceeding $3' \cdot 6$ in amount, was $6' \cdot 7$ at Toronto, and $5' \cdot 7$ at Hobarton. It may be convenient to notice here that the approximate value of the horizontal force at Toronto is $3 \cdot 5$, and at Hobarton $4 \cdot 5$, both expressed in absolute measure.

Table XXIX. contains a detailed statement of the 5322 disturbed observations between January 1841, and July 1848; showing* the days and hours of their occurrence in Göttingen time, the amount of disturbance, and the direction towards which the north end of the magnet was deflected: the sign + implies that the deflection was towards the east, and - towards the west. Toronto time is $5^{\text{h}} 57^{\text{m}}$ later than Göttingen time.

TABLE XXIX.

Showing the Göttingen Time of the occurrence,—together with the direction and amount of the deflection from the Mean Position of the Magnet in the same Month and at the same hour,—of the 5322 largest Disturbances of the Declinometer in the Two-hourly Observations, commencing January 1st, 1841, and ending June 30th, 1842, and in the Hourly Observations, commencing July 1st, 1842, and ending June 30th, 1848. One Scale Division = 0°.721 of Declination. The dates are in Astronomical Time.

HORIZONTAL FORCE.

*Bifilar Magnetometer.**—The adjustments described in the 1st volume of the Toronto observations, pp. xxxiv. and xxxv., remained undisturbed till February 10th, 1843, when the magnet (No. 2) was withdrawn to have its temperature correction examined; its place being temporarily supplied by another 12-inch magnet, of which the scale-coefficient was ascertained in the usual manner to be .000149. On the 25th of February, 1843, the magnetometer was readjusted with the magnet No. 2, in the manner prescribed in the Instructions of the Royal Society; the angle v , viz., the angle through which the torsion circle required to be moved, in order to deflect the magnet into a position perpendicular to the magnetic meridian, was $49^{\circ} 14'$; the arc-value of a division of the scale being, in parts of radius, $0' 000114$, the value of a single scale division in parts of the horizontal force was

$$k = 0' 000114 \cdot \cot 49^{\circ} 14' = 0' 000099.$$

The suspension wire was the same that had been in use since the commencement of the observations. For some months after the adjustment the scale readings were perceived to undergo a progressive change, indicative of some derangement the cause of which was not very obvious: the change was in the direction that might be produced by an elongation of the wire, being the opposite to that which would be occasioned by a loss of force in the magnet. It amounted on an average to about 2 scale divisions in a day; the mean monthly scale-readings for the months following the adjustment were as follows:—

| | | | |
|-------|------------|--------|------------------|
| 1843. | March, | 660·3 | scale divisions. |
| , | April, | 726·4 | , |
| , | May, | 795·3 | , |
| , | June, | 841·2 | , |
| , | July, | 894·0 | , |
| , | August, | 936·8 | , |
| , | September, | 1069·8 | , |

Between February 25th and October 11th of the same year the scale-readings had altered 470 divisions, equivalent (approximately) to .044 parts of the whole horizontal force. On the 11th October, 1843, the magnet was brought back to a position nearly perpendicular to the magnetic meridian, by turning the torsion circle $3^{\circ} 29'$, making $v = 52^{\circ} 43'$, and $k = 0' 000087$. This proceeding seems to have arrested the change in great measure, and the instrument remained under the same adjustment to the end

* The determinations of the absolute value of the horizontal force obtained with the unifilar magnetometer will be discussed in a subsequent section.

of 1848. The mean scale-reading, reduced to a temperature of 50° , in the last three months of 1843 was $496\cdot 9$.

| 1848 | 630·0 |

showing a change of a similar character, but of much smaller amount, and the greater part taking place in the first few months after the re-adjustment.

That no increase took place in the magnetic moment of the magnet during this period,—but, on the contrary, a small decrease,—is shown by the following times of vibration of the magnet suspended as an unifilar magnet; the times of vibration are corrected for the arc and for the rate of the chronometer.

TABLE XXX.

| | DATES. | Corrected Time of Vibration. | Temperature. | Change in the Magnetic Moment for 1° of Fahr. |
|-------|----------|------------------------------------|--------------|--|
| 1841 | Feb. 11 | 14·668 | — | ·000224 |
| | March 16 | 14·717 | 42·0 | |
| | April 30 | 14·750 | 55·6 | |
| | May 31 | 14·733 | 65·0 | |
| | June 1 | 14·783 | 76·0 | |
| | Aug. 1 | 14·752 | 69·2 | |
| 1843. | Feb. 22 | 14·840 | 60·5 | |
| 1849. | March 1 | 14·881 | 60·5 | |
| | ,, 2 | 14·902 | 60·5 | |

The absolute determinations show that during this period there was also a small secular decrease in the horizontal force of the earth. The increase of the scale readings appears therefore to be attributable to a decrease in the moment of torsion, such as would be produced by an elongation of the silver suspension wire.

In February 1849, the magnetometer was dismounted to make a new arrangement of the instruments in the Observatory, in consequence of the introduction of self-recording instruments. In dismounting the bifilar, the value of the scale-coefficient was re-examined by going through each part of the process of adjustment in the reverse order, and thus retracing the several steps. By this proceeding the angle v was found = $53^{\circ} 00'$; whence $k = \cdot 000088$, which is almost identical with the value obtained in October, 1843. The coefficient employed for the whole intervening time has been $\cdot 000087$.

The experiments made in February 1843, and recorded in vol. 1, pp. xxxii and xxxiii, for the purpose of ascertaining the temperature coefficient, not having been considered

as final on account of the small amount of the angles of deflection, a new series was made in April 1849, employing a portable unifilar magnetometer, and placing the suspending and deflecting magnets at the distance of 24 inches from centre to centre. The deflections thus obtained exceeded 33° . The magnet (No. 2) was submersed in water, the temperature of which was successively raised and lowered about 10° at a time between the temperatures of 40° and 90° . Five distinct determinations were thus obtained at as many points of the thermometric scale, each including from 30 to 40 partial results. Corresponding observations were made by auxiliary apparatus for the purpose of obtaining the changes of declination and horizontal force occurring during the course of the experiments, and corrections on account of these changes were applied. The following were the results :—

| Mean Temperature. ° | Value of q . |
|------------------------|----------------|
| 44·4 | ·0001990 |
| 56·0 | ·0002278 |
| 67·1 | ·0002257 |
| 77·5 | ·0002388 |
| 86·7 | ·0002326 |
| <hr/> 65·2 | <hr/> ·0002236 |

The value of the coefficient increasing but very slowly with the temperature, the mean of the five series has been taken as sufficiently exact for all temperatures; including the usual addition of ·00001 for the effect of variations of temperature upon the bifilar suspension apparatus, $q = \cdot 000234$.

Diurnal Variation.—Tables XXXI., XXXII., and XXXIII., exhibit the diurnal variation of the horizontal force derived from the monthly means of the bifilar magnetometer from January 1843, to June 1848, inclusive, reduced to an uniform temperature of the magnet, and expressed in parts of the horizontal force; the lowest monthly mean occurring at any of the observation hours has been taken as the zero of the month, and corresponds to the weakest force.

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

TABLE XXXI.—*Diurnal Variation of the Horizontal Force in the several Months,*
The lowest Monthly Mean occurring at any of the observation hours has

| Mean of the whole Year. } | -013 | -019 | -025 | -024 | -018 | -013 | -009 | -020 | -037 | -052 | -074 | -072 |

The diurnal variation of the Horizontal Force at Toronto has a principal maximum at alittle after 4^h at all seasons; and a principal minimum at 22^h or 23^h, occurring earlier from April to September than from October to March. From the minimum at 22^h or 23^h the force increases continuously to the maximum at or shortly after 4^h. From the maximum at 4^h the force diminishes to a secondary minimum about 14^h or 15^h, occurring earlier than 14^h from October to March, and about 15^h from April to September; and again increases to a secondary maximum about 18^h, occurring somewhat earlier from April to September than from October to March. From 18^h the force progressively decreases to the minimum at 22^h or 23^h.

The diurnal variation of the horizontal force is thus a double progression at all seasons of the year, and its range or whole amount is considerably greater from April to September than from October to March.

The mean diurnal variation of the horizontal force at Toronto and Hobarton, exhibited in comparison and expressed in absolute value, is as follows:—

Corrections on account of the Diurnal Variation for the different months of the year.— Table XXXIII, page lix, supplies for every month of the year corrections to the mean horizontal force in the month to be applied to observations made at any one of the observation hours. In applying the values in this table as corrections, it will be remembered that the opposite sign to that in the table must always be employed.

VERTICAL FORCE.

Vertical Force Magnetometer.—The variations of the Vertical Force at Toronto have continued to be observed by the instrument described in Vol. I., p. liii.

The times of vibration in the horizontal plane observed in 1840 and 1841 are stated in Vol. I., *l. c.*, terminating with $11^{\circ}496$, on the 30th of September, 1841. The next observation appears to have been made on March the 26th, 1846, when the magnet was dismounted for temperature experiments, and the time of vibration was found to be $11^{\circ}50$, or nearly identical with the last observation in 1841. The magnet was magnetized afresh on the 1st of April, 1846, and its time of horizontal vibration was then found to be $10^{\circ}29$; it was again observed on February the 28th, 1849, and found $10^{\circ}36$; and on June the 2nd, 1850, also $10^{\circ}36$. The times of vibration in the vertical plane in 1841 and 1842, are stated in Vol. I., pp. liv and lv. The observations were made usually at weekly intervals until February, 1849, after which date they were made only on the monthly term days. The mean times of vertical vibration in the several months from 1843 to 1851, inclusive, are shown in the following Table.

TABLE XXXV.

^a Magnet employed in Temperature experiments.

^b Needle remagnetized.

^c Vertical Force Magnetometer dismounted whilst preparations were making for photographic instruments.

The values of the scale coefficient, computed for each month from the times of vibration in the horizontal and vertical planes and the magnetic inclination, are given at the head of the pages in which the observations of the vertical force in the same months are recorded.

Temperature Coefficient.—The experiments to determine the value of the temperature coefficient were made in the detached building. The suspended magnet was 3·0 inches in length, and the Vertical Force Magnet was so placed that its axis should be in a line perpendicular to the suspended magnet when deflected. In the first experiment the V. F. magnet and a thermometer were enclosed in a copper water-tight case, which was fixed firmly in a trough, capable of containing a quantity of water sufficient to surround the case and impart the required temperature to the magnet within; it was found, however, that the condensation of the moist air inside the case exposed the axles to as much risk of injury as if they were entirely wetted: in subsequent experiments, therefore, the water-tight copper case was dispensed with, and the magnet itself was immersed in the water.

During the first experiment, the distance between the centres of the suspended and deflecting magnets was 20 inches; in the subsequent experiments the distance was about 17 inches.

Previous to the second experiment the needle was remagnetized; after which it was found that the magnetic moment had been increased by the process, and consequently the angle of deflection was considerably greater in the later experiments than in the first.

Table XXXVI. contains an abstract of the experiments; the means only are stated, each mean being the result of three distinct observations, made at intervals of about two minutes. The numbers in the 3rd and 5th columns are the differences respectively of the observed temperatures and declinometer-readings on the same horizontal line, from the mean of the temperatures and declinometer-readings in the line above and in the line below.

The values of the temperature coefficient derived from the experiments recorded in Table XXXVI., are as follows:—

| | | | | | |
|---------|---------|----------|---------|-----------|---------|
| Exp. I. | 000061 | Exp. IV. | ·000074 | Exp. VII. | ·000073 |
| „ II. | 000063 | „ V. | ·000078 | „ VIII. | ·000075 |
| „ III. | ·000070 | „ VI. | ·000067 | „ IX. | ·000074 |

The mean value is 00007, which has accordingly been employed in reducing the observations of the vertical force recorded in this volume to a uniform temperature.

Diurnal Variation.—Tables XXXVII., XXXVIII., and XXXIX. show the diurnal variation of the vertical force, expressed in parts of the force, in each month from January 1843, to June 1848, inclusive, with the exception of November and December 1843, and January 1844, when the magnet was removed for temperature experiments. The observations during the whole of the period comprised by these Tables were made hourly: the corresponding abstract of the two-hourly observations in 1841 and 1842 is given in Tables XLI. and XLII. of Vol. I., pp. lviii and lix.

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

TABLE XXXVII.—*Diurnal Variation of the Vertical Force in the several Months*
The lowest Monthly Mean corresponding to any of the observation hours has

TABLE XXXIX.

Exhibits the Differences of the Vertical Force at each observation hour from the Mean Force in the Month ; the sign + implies that the force is greater than the Mean Force, and - that it is less.

The diurnal variation of the vertical force at Toronto, in both seasons, *i. e.*, from April to September inclusive, and from October to March inclusive, is a double progression, having two maxima and two minima. The principal maximum takes place two hours earlier from April to September than from October to March, viz., at 5^h from April to September, and at 7^h from October to March. From this maximum the diminution is progressive to the principal minimum, which also occurs earlier from April to September than from October to March; *i. e.*, between 14^h and 15^h from April to September, and at 16^h from October to March. The secondary minimum is at 22^h in both seasons. The range of the diurnal variation is greater during the six months when the sun is north of the equator, or from April to September, than in the opposite season.

DIURNAL VARIATIONS OF THE INCLINATION AND TOTAL FORCE.

Having then the diurnal variation of the horizontal and of the vertical force, we may derive from them the diurnal variations of their theoretical equivalents, the inclination and the total force. The diurnal variation of the inclination is shown in Tables XL., XLI., and XLII.;—that of the total force in Tables XLIII., XLIV., and XLV.

Diurnal Variation of the Inclination.—(Tables XL., XLI., XLII., pp. lxxii. to lxxxvii). The magnetic inclination at Toronto has a principal minimum in all months of the year about the hour of 4, occurring, however, somewhat earlier from April to September than from October to March; and a principal maximum about 22^h or 23^h, occurring also earlier from April to September than from October to March. The progression from the maximum at 22^h or 23^h to the minimum at 4^h is continuous and rapid. From April to September the inclination increases, with occasional very slight interruptions, from the minimum at 4^h to the maximum at 22^h. At this season, therefore, the diurnal variation scarcely differs from a single progression, the decrease taking place in the six hours from 22^h to 4^h, and the increase more slowly in the remaining eighteen hours. In the opposite season, from October to March, a secondary maximum shows itself at from 12^h to 14^h, and a secondary minimum at about 18^h.

Diurnal Variation of the Total Force.—(Tables XLIII., XLIV., XLV., pp. lxxviii. to lxxxiii.). The Total Force at Toronto has a principal maximum at 5^h at all seasons, and a principal minimum between 15^h and 16^h, occurring earlier from April to September than from October to March; the decrease from the maximum at 5^h to the minimum at 15^h or 16^h is continuous and uninterrupted at all seasons. From the minimum at 15^h or 16^h the force increases to a secondary maximum, varying in its occurrence in different months from 18^h to 20^h, and being earliest in the months from April to September. A decrease then takes place to a secondary minimum at

22^h or 23^h (earlier also from April to September); and from this secondary minimum to the principal maximum at 5^h the increase is continuous. There is, therefore, at all the seasons of the year, a double progression in the diurnal variation of the Total Force, having—

- A principal maximum at . . . 5 hours
- A principal minimum at 15 or 16 , ,
- A secondary maximum at 18 to 20 , ,
- A secondary minimum at 22 or 23 , ,

If we compare the deduction now made from the series of 5½ years of hourly observation with that drawn from the two-hourly series of observations from 1841 and 1842 in Vol. I. pp. lxi. and lxii., we find the accordance to be most satisfactory, but as might be expected, the deduction from the more extensive series has greater precision.

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

TABLE XL.—*Diurnal Variation of the Inclination in the several months of 1843–1848.*
The lowest Monthly Mean occurring at any of the observation hours has

TABLE XLII.

Exhibiting the Differences of the Inclination at each observation hour from the Mean in the Month; the sign + implies that the North Inclination is greater than the Mean Inclination, and - that it is less.

TABLE XLV.

Exhibits the Differences of the Total Force at each observation hour from the Mean Force in the month; the sign + implies that the force is greater than its Mean value in the Month and - that it is less.

VARIATION OF THE DIURNAL RANGE.

Tables XLVI., XLVII., XLVIII., and XLIX. show the inequality or variation in the amount of the diurnal range of the Horizontal and Vertical Force, and of the Inclination and Total Force, in different years, and in different seasons of those years. The explanation given in the concluding paragraph in p. xxi. of the present volume, of the corresponding tables of the variation in the diurnal range of the declination, is applicable to these tables also.

TABLE XLVI.

Mean Magnitude of the Diurnal Range of the Horizontal Force, from 1841 to 1851 inclusive, in parts of the Horizontal Force.

| YEARS. | Winter. | | Spring&Autumn | Summer. | Mean of the whole Year. | YEARS. |

| 1843 | ·00028 | ·00040 | ·00040 | ·00036 | 1843 |
| 1844 | ·00027 | ·00059 | ·00039 | ·00042 | 1844 |
| 1845 | ·00032 | ·00038 | ·00046 | ·00039 | 1845 |
| 1846 | ·00020 | ·00059 | ·00077 | ·00052 | 1846 |
| 1847 | ·00048 | ·00064 | ·00052 | ·00055 | 1847 |
| 1848 | ·00049 | ·00064 | ·00055 | ·00056 | 1848 |

The values for 1848 in Tables XLVIII. and XLIX. include a part of the observations of that year which were not included in the corresponding Tables published in the Phil. Trans. for 1852, Art. viii., pp. 119-120 ; and are therefore *slightly* different from the values given in the paper referred to.

MAGNETIC INCLINATION.

The custom, described in the first volume of the Toronto Observations, of making eight determinations of the Inclination in each month, at nearly equal intervals in the month, and taking for this purpose Tuesdays in the forenoon, and Fridays in the afternoon, as the times of observation, was continued from April 1841, to December 1847 inclusive. Commencing with January 1848, the same number, or occasionally a greater number, of partial determinations was made monthly ; but instead of the Tuesdays and Fridays, the days of observation were the same as those in which the absolute values of the horizontal force were determined, namely, three days in every

month, usually the 16th, 17th, and 18th of the month. The Inclinometers employed were one of Gambey's and one of Robinson's of the same pattern as those of Gambey; both were circles of nine inches diameter; with these circles several needles were employed, all made by the same eminent artists: No. 1 (Robinson) from January 1841, to March 1844; O.S. 1 (Robinson) from March to June 1844; O.S. 2 (Robinson) from June 1844, to December 1845; G 1 (Gambey) from January to March 1846; R 1 (Robinson) from April 1846 to April 1847; R 1 (with a new axle) May to August 1847; and R 2 (Robinson) from September 1847 to the most recent date.

That there may have been small instrumental differences affecting results obtained with so many different instruments, and that the intercomparability of the results might have been more perfect if the same circle and needle had been used throughout, is very possible. The needle to which there appears most reason to ascribe a small difference from the others, is G 1 of Gambey. G 1 was compared with G 2, a second needle by the same excellent artist, and with O.S. 2, one of Robinson's, by a number of determinations, made expressly with the three needles, on different days during the months of November and December 1845; the results were as follows:—

| G. 1. (Gambey.) | O S. 2. (Robinson) | G. 2. (Gambey). |
|--------------------|--------------------|--------------------|
| 1845 ° ' | 1845 ° ' | 1845 ° ' |
| Nov. 7 75 14·9 | Nov. 7 75 15·5 | Nov. 13 75 11·4 |
| 8 75 12·6 | 7 75 16·1 | 14 75 15·2 |
| 13 75 12·7 | 13 75 15·1 | 15 75 13·8 |
| 14 75 12·5 | 13 75 14·8 | 17 75 15·3 |
| 15 75 12·8 | 14 75 22·2 | 17 75 17·8 |
| 18 75 16·3 | 14 75 14·2 | 21 75 16·5 |
| 18 75 14·6 | 14 75 12·9 | Dec. 2 75 18·1 |
| Dec. 6 75 14·9 | 17 75 15·2 | 2 75 16·8 |
| 15 75 12·7 | 17 75 15·4 | 6 75 15·2 |
| 16 75 15·4 | 18 75 16·6 | 15 75 17·7 |
| 17 75 13·1 | | 16 75 17·3 |
| Mean 75 13·86 | Mean 75 16·40 | 17 75 15·2 |
| | | 18 75 14·7 |
| | | Mean 75 15·77 |

The mean results with O.S. 2 and G 2 differ only 0·63; the probable error of the mean result with O.S. 2, is $\pm 0\cdot12$, and with G 2, is $\pm 0\cdot11$. The mean result with G 1 differs from G 2 by 1·91; and from O.S. 2, by 2·54. On the strength of this comparison 2·2 have been added to each of the monthly results obtained with G 1, in the three months during which it was employed. It is probable that there was some slight imperfection in the curvature of the axle of this needle in the part on which it rested at Toronto.

The observations of the Inclination from their commencement to the end of 1842 are recorded in detail in the first volume of the Toronto Observations, pp. 328-332;

those from January 1843 to December 1851 will be found in the latter part of the present volume. The following table exhibits in one view the mean monthly results in the twelve years comprised between January 1841 and December 1852.

TABLE L.

Monthly Means of the Observations of the Inclination from January 1841 to December 1852, inclusive.

| MONTHS. | 1841 | 1842 | 1843 | 1844 | 1845 | 1846 | 1847 | 1848 | 1849 | 1850 | 1851 | 1852 | Means for each Month. | $\theta' - \theta$ |

* 2°·2 added for index error, page lxxxvi.

Annual Variation.—The values in the column entitled $\theta' - \theta$, which are the differences between the mean Inclination in the whole period and the means of the several months include the joint effects of annual variation and secular change. As the annual amount of secular change is very small, it may be eliminated by an approximate value, derived in the usual manner from the mean inclination in the several years from 1841 to 1852, placed in the bottom line of Table L. These give an annual increase of 0°·51, or a monthly increase of 0°·042; and the values of $\theta' - \theta$, corrected in proper proportion for this amount of secular change, become as follows:—

| | | | | | | | |
|------------------|--------|--------|----------|-------------------|--------|--------|----------|
| January | +0°·64 | +0°·23 | = +0°·87 | July | -1°·53 | -0°·02 | = -1°·55 |
| February | +0°·02 | +0°·19 | = +0°·21 | August | -1°·14 | -0°·06 | = -1°·20 |
| March | -0°·28 | +0°·15 | = -0°·13 | September | +0°·86 | -0°·11 | = +0°·75 |
| April | -0°·43 | +0°·11 | = -0°·32 | October | +0°·99 | -0°·15 | = +0°·84 |
| May | -0°·35 | +0°·06 | = -0°·29 | November | +1°·51 | -0°·19 | = +1°·32 |
| June | -0°·17 | +0°·02 | = -1°·15 | December | +0°·94 | -0°·23 | = +0°·71 |

The annual variation which these results indicate may perhaps be not unfitly represented by the first term of the usual formula for periodical functions $\theta^x = \theta + u \sin(a + U)$, in which θ^x is the Inclination at the required period x , θ the mean Inclination in the year, $a = 30^\circ \times n$, in which n denotes the interval in time in months and parts

of a month between x and the 15th of January, and u and U are constants obtained from the results in the usual manner. This formula becomes in the present case—

$$\theta_x = 75^\circ 17' 2 - 1' 11 \sin(a + 302^\circ 1);$$

whence the mean inclination in the several months, and the annual variation, are as follows:—

| | | | | |
|---------------------|-------------------|---|--------------------------|-----------|
| January | $75^\circ 18' 14$ | ; | and the Annual Variation | $+ 0' 94$ |
| February | $75^\circ 17' 72$ | , | , | $+ 0' 52$ |
| March | $75^\circ 17' 16$ | , | , | $- 0' 04$ |
| April | $75^\circ 16' 61$ | , | , | $- 0' 59$ |
| May | $75^\circ 16' 22$ | , | , | $- 0' 98$ |
| June | $75^\circ 16' 09$ | , | , | $- 1' 11$ |
| July | $75^\circ 16' 26$ | , | , | $- 0' 94$ |
| August | $75^\circ 16' 69$ | , | , | $- 0' 52$ |
| September | $75^\circ 17' 24$ | , | , | $+ 0' 04$ |
| October | $75^\circ 17' 79$ | , | , | $+ 0' 59$ |
| November | $75^\circ 18' 18$ | , | , | $+ 0' 98$ |
| December | $75^\circ 18' 31$ | , | , | $+ 1' 11$ |

Or, a maximum of north inclination in December, and a minimum in June, being the two solstitial months; with a total range of annual variation from the one solstice to the other of $2' 22$.

Secular Change.—From the intercomparison of the mean inclination in the several years shown in the bottom line of Table L., we have to seek the character and amount of secular change during the period comprised by the observations. On a first inspection of the values of the inclination in the years from 1841 to 1852 inclusive, we might be led to infer that in 1843 or 1844 the secular change at Toronto reached a turning epoch; and that, from having been previously a decrease, it became subsequently an increase of inclination. It is possible, however, that the facts may admit, and may hereafter receive, a different explanation. It has been shown in the analysis of the larger disturbances of the *Declination*, that the aggregate value of the easterly disturbances at Toronto preponderates over that of the westerly disturbances, and consequently that the mean Magnetic Declination in the year must have, as one of its constituents, a small but appreciable easterly element, due to the greater prevalence of easterly disturbances. If the disturbances took place in every year to the same, or nearly to the same, amount, and always maintained the same proportion of easterly and westerly deflections, their influence on the mean magnetic direction would be a constant quantity in all years; but if, on the other hand, the amount of disturbance in different years be subject to a periodical variation, affecting the aggregate amount of disturbance, but not materially affecting the proportion of its easterly and westerly constituents, the absolute Declination at Toronto must be subject to a periodical variation not hitherto taken into account, having epochs corresponding to those which have

was found to exist in the disturbances. Such a variation might be expected to show itself on a sufficient continuance of careful observation, and might be separated thereby from the secular change, which, until this variation were so determined and separated, would appear to be affected by a corresponding irregularity. An analysis of the larger disturbances of the *Inclination*, similar to that of the larger disturbances of the Declination, has not yet been made; but a very cursory examination of the registries of the Horizontal and Vertical Force Magnetometers is sufficient to show that the disturbances of the Inclination and Total Force are subject to a periodical variation, similar to that which has been found to affect the Declination disturbances, with alternate epochs of maximum and minimum, at intervals of about five years. If at Toronto the aggregate effect of the disturbances be to increase the Inclination, and if 1843–1844 be an epoch of minimum, and 1848–1849 an epoch of maximum disturbance, the periodical augmentation of the Inclination due to the disturbance should be a minimum also in 1843 or 1844, and a maximum in 1848 or 1849. Until the amount of the augmentation due to this cause, and its periodical variation, be ascertained and eliminated in the inquiry respecting *secular change*, the secular change itself will appear to be affected by an irregularity, not altogether dissimilar in character to that which is presented by the mean Inclinations in the bottom line of Table L. The train of inquiry which has been thus indicated may perhaps be more advantageously pursued when the disturbances of the Inclination shall have been analysed, as those of the Declination have been: in the meantime, considering the small amount of the apparent irregularities, together with the variety of needles employed in the observations of the different years, and the consequent possibility of defective intercomparability, we may perhaps take as the best present approximation, such an uniform increase of Inclination from secular change, during the whole period, as may best satisfy the means of the several years. The secular change in this view is an annual increase of $0' \cdot 51$.

HORIZONTAL FORCE.

In Absolute Measure.—The monthly series of absolute determinations of the Horizontal Force commenced in January 1845; they were made with a deflecting magnet of 3·67 inches in length, and a suspended magnet of 3 inches, both being solid cylinders of 0·3 inch diameter. The same magnets were used throughout the series. The observations were made about the same period in every month, usually on the 16th, 17th, and 18th of the month. Three distances were employed, the least being 1 foot and the greatest 1·4 foot from the centre of the suspended magnet. The deflections were read on a circle of 6 inches diameter, having two verniers reading to $20''$. The reading telescope was attached to and moved with the azimuth circle; the deflecting magnet was therefore always perpendicular to the suspended magnet when the deflections

caused by the latter were read off. The deflecting magnet was suspended for vibration in a stirrup with a mirror, in a detached wooden box, by a silk thread of which the line of detorsion was brought approximately into the magnetic meridian. Concurrent readings were taken with the Observatory Bifilar, furnishing the means of reducing the results of each of the absolute determinations to the mean Horizontal Force of the month in which it was made. The details of the observations, with an explanatory memorandum drawn up by Captain Younghusband, are given in the latter part of this volume. As *absolute* determinations, the results can only yet be considered as provisional, as the exact values of the distances between the centres of the suspended and deflecting magnets, and of the constants of inertia and of induction, have to be finally determined with the new standard scale and weights on the return of the Unifilar to England, which will shortly take place: but as the mutual relation of the results will be unaffected by slight changes in the constants common to the whole series, we may proceed to employ them at once in the theoretical deductions to which a body of results *relatively* correct may be applicable.

Collecting in one view the mean monthly determination of the Horizontal Force in the eight years from January 1845 to December 1852 inclusive, we have the values in the following Table:—

TABLE LI.

Monthly Means of the observed Values of the Horizontal Force in absolute measure from January 1845 to December 1852 inclusive.

| MONTHS. | 1845 | 1846 | 1847 | 1848 | 1849 | 1850 | 1851 | 1852 |
|-------------------|--------|--------|--------|--------|--------|--------|--------|--------|
| January | 3·5397 | 3·5419 | 3·5384 | 3·5279 | 3·5272 | 3·5223 | 3·5195 | 3·5225 |
| February | 3·5392 | 3·5341 | 3·5336 | 3·5261 | 3·5270 | 3·5265 | 3·5207 | 3·5185 |
| March | 3·5437 | 3·5406 | 3·5315 | 3·5323 | 3·5277 | 3·5278 | 3·5235 | 3·5182 |
| April | 3·5395 | 3·5376 | 3·5308 | 3·5305 | 3·5300 | 3·5312 | 3·5233 | 3·4986 |
| May | 3·5411 | 3·5357 | 3·5320 | 3·5320 | 3·5340 | 3·5333 | 3·5292 | 3·5069 |
| June | 3·5463 | 3·5379 | 3·5350 | 3·5270 | 3·5328 | 3·5319 | 3·5264 | 3·5013 |
| July | 3·5403 | 3·5407 | 3·5323 | 3·5306 | 3·5350 | 3·5210 | 3·5251 | 3·5055 |
| August | 3·5405 | 3·5344 | 3·5352 | 3·5305 | 3·5350 | 3·5192 | 3·5240 | 3·5103 |
| September | 3·5402 | 3·5322 | 3·5280 | 3·5277 | 3·5333 | 3·5159 | 3·5263 | 3·5079 |
| October | 3·5412 | 3·5308 | 3·5278 | 3·5254 | 3·5253 | 3·5223 | 3·5194 | 3·5068 |
| November | 3·5370 | 3·5309 | 3·5274 | 3·5206 | 3·5288 | 3·5312 | 3·5245 | 3·5073 |
| December | 3·5407 | 3·5369 | 3·5315 | 3·5241 | 3·5275 | 3·5233 | 3·5219 | 3·5067 |
| Annual Means. | 3·5408 | 3·5361 | 3·5320 | 3·5279 | 3·5303 | 3·5255 | 3·5237 | 3·5092 |

On examining the results in Table LI., we may at once perceive that there are irregularities in 1852 which much exceed those of any of the preceding years. The mean monthly value of the Force in April 1852, for example, differs from that of the preceding month by ·0196, a quantity which is much greater than the difference between any two months whatsoever in any of the preceding years; it is equivalent to a change in the Inclination of about 4° 5', whilst the direct observations recorded in Table L. show that no greater difference took place in the Inclination between the months of March

and April 1852 than $0'4$. Again, the *mean* Horizontal Force in the year 1852, in Table LI., differs $.0145$ from the amount in 1851, which is equivalent to $3'7$ of Inclination; whilst in Table L. the difference between 1851 and 1852 is shown by direct observation to have been not more than $0'1$. The Horizontal Force observations for 1852 have only recently been received at Woolwich, and it is possible that inquiries which have been instituted may lead to the discovery of the existence of some accidental cause for the unprecedented irregularities in 1852. In the meantime it appears the more safe course to confine the discussion of the results for the present to the seven years from 1845 to 1851 inclusive.

Secular Change.—From the annual means (1845 to 1851) in Table LI., we obtain 3.5309 as the most probable value (subject to the final correction of the constants as above mentioned) of the Horizontal Force in the middle of the year 1848; and a decrease of $.0026$ as the mean annual secular change in those years. If we assume that no secular change exists in the total force at Toronto, and that the secular change in the Horizontal Force is consequently wholly due to that of the Inclination, an annual decrease of $.0026$ will be equivalent to an annual increase of $0'67$ in the Inclination: the actual annual increase derived in page lxxxvii. from the direct observations of the Inclination between 1841 and 1852 is $0'51$.

Annual Variation.—The mean monthly values of the Horizontal Force in the seven years from 1845 to 1851, inclusive, with the corrections necessary to eliminate the influence of an annual secular decrease of $.0026$, are as follows:—

| | Monthly Means. | Corr. for Secular Change. | Monthly Means Corrected. | X'—X |
|-----------------|----------------|---------------------------|--------------------------|---------|
| January . . . | 3.5310 | — .0012 | 3.5298 = X'; | — .0011 |
| February . . . | 3.5296 | — .0010 | 3.5286 = X'; | — .0023 |
| March . . . | 3.5324 | — .0008 | 3.5316 = X'; | + .0007 |
| April . . . | 3.5318 | — .0005 | 3.5313 = X'; | + .0004 |
| May . . . | 3.5339 | — .0003 | 3.5336 = X'; | + .0027 |
| June . . . | 3.5339 | — .0001 | 3.5338 = X'; | + .0029 |
| July . . . | 3.5321 | + .0001 | 3.5322 = X'; | + .0013 |
| August . . . | 3.5313 | + .0003 | 3.5316 = X'; | + .0007 |
| September . . . | 3.5291 | + .0005 | 3.5296 = X'; | — .0013 |
| October . . . | 3.5275 | + .0008 | 3.5283 = X'; | — .0023 |
| November . . . | 3.5286 | + .0010 | 3.5296 = X'; | — .0013 |
| December . . . | 3.5294 | + .0012 | 3.5306 = X'; | — .0003 |
| | | | 3.5309 = X. | |

The values of $X'—X$ show the quantities by which the observed Horizontal Force in the several months exceeds or falls short of the mean force in the year. These quantities may be represented (as in the case of the annual variation of the Inclination, page lxxxvii) by the first term of the usual formula, which here becomes $X_x = 3.5309 + .002 \sin(a + 312'1)$, a being reckoned from the 15th of January. This formula gives a minimum of force in December, and a maximum in June, with a total range

from the one solstice to the other of .0038. The range of the annual variation of the Inclination between December and June ($2' \cdot 22$) is equivalent, in the resolution of the total force into its Horizontal and Vertical components, to .0087 of Horizontal Force; and the Inclination being greatest in December and least in June, the Horizontal Force in conformity therewith should be .0087 greater in June than in December. By the observations it appears, however, that the excess in June over December is not more than .0038; we may therefore infer the probable existence of an annular variation of the total force compensating the difference; the total force being greater at the time of the December, than at the time of the June solstice. This will be more distinctly shown by a combination of the septennial mean monthly values of the Inclination and Horizontal Force, producing the mean monthly values of the Total Force.

Annual Variation of the Total Force.—From the mean monthly values of the Horizontal Force (1845 to 1851) in Table LI., and from those of the Inclination for the same years in Table L., we obtain the following mean monthly values of the total force:—

| | | | |
|----------------------------|--|---|---------------|
| January | $3 \cdot 5310 \times \sec 75^{\circ} 18 \cdot 7$ | = | 13.926 |
| February | $3 \cdot 5296 \times \sec 75^{\circ} 18 \cdot 1$ | = | 13.911 |
| March | $3 \cdot 5324 \times \sec 75^{\circ} 17 \cdot 2$ | = | 13.908 |
| April | $3 \cdot 5318 \times \sec 75^{\circ} 17 \cdot 1$ | = | 13.904 |
| May | $3 \cdot 5339 \times \sec 75^{\circ} 17 \cdot 3$ | = | 13.915 |
| June | $3 \cdot 5339 \times \sec 75^{\circ} 16 \cdot 9$ | = | 13.909 |
| July | $3 \cdot 5321 \times \sec 75^{\circ} 16 \cdot 2$ | = | 13.891 |
| August | $3 \cdot 5313 \times \sec 75^{\circ} 16 \cdot 8$ | = | 13.897 |
| September | $3 \cdot 5291 \times \sec 75^{\circ} 18 \cdot 3$ | = | 13.913 |
| October | $3 \cdot 5275 \times \sec 75^{\circ} 18 \cdot 4$ | = | 13.908 |
| November | $3 \cdot 5286 \times \sec 75^{\circ} 18 \cdot 7$ | = | 13.916 |
| December | $3 \cdot 5294 \times \sec 75^{\circ} 18 \cdot 2$ | = | 13.912 |
| Mean of the Year | | | <u>13.909</u> |

The differences between the mean force in the year and its mean monthly values include the joint effects of secular change and annual variation. In respect to the secular change, the observations of the Inclination and of the Horizontal Force in the years 1845 to 1851 furnish the mean values of the total force in each year as follows:—

| Years. | |
|--------|--|
| 1845 | $3 \cdot 5408 \times \sec 75^{\circ} 15 \cdot 5$ |
| 1846 | $3 \cdot 5361 \times \sec 75^{\circ} 15 \cdot 1$ |
| 1847 | $3 \cdot 5320 \times \sec 75^{\circ} 15 \cdot 3$ |
| 1848 | $3 \cdot 5279 \times \sec 75^{\circ} 18 \cdot 3$ |
| 1849 | $3 \cdot 5303 \times \sec 75^{\circ} 18 \cdot 8$ |
| 1850 | $3 \cdot 5255 \times \sec 75^{\circ} 20 \cdot 0$ |
| 1851 | $3 \cdot 5237 \times \sec 75^{\circ} 20 \cdot 4$ |

It would be unsafe to make any more precise conclusions from these results than that the secular change of the total force at Toronto, at the epoch of the observations, must have been extremely small; and that it would require a longer continuance of

the observations to determine either its average annual amount, or even whether the force were increasing or decreasing. It is not impossible that the variations of the total force in different years arising from the greater or less predominance of the phenomena characterized as "Disturbances," may bear a large proportion to, or may even exceed, the progressive variation due to secular change, where the latter is so extremely small: in such case one complete cycle of the disturbance-variations (or 10 years) would be the minimum from which any satisfactory conclusion respecting the secular change could be drawn. Whatever may be its amount, however, or its direction, it may be eliminated (on the hypothesis of its being a uniform progression) by combining together the months equi-distant from the middle period of the year. We have thus:—

| | | |
|---|--------------------------|-------------------------|
| January and December ; | Mean 13·9190 = ϕ' ; | $\phi' - \phi$ = +·0100 |
| February and November ; | ,, 13·9135 = ϕ' ; | ,, = +·0045 |
| March and October ; | ,, 13·9080 = ϕ' ; | ,, = -·0010 |
| April and September ; | ,, 13·9085 = ϕ' ; | ,, = -·0005 |
| May and August ; | ,, 13·9060 = ϕ' ; | ,, = -·0030 |
| June and July ; | ,, 13·9000 = ϕ' ; | ,, = -·0090 |
| Mean of the Year . . . <u>13·909</u> = ϕ . | | |

Confirming the previously drawn inference that the Total Force at Toronto is least about the time of the June solstice, and greatest about the time of the December solstice; the numerical difference in its value at the two solstices is approximately ·0190 in absolute measure; whence we may finally conclude that the total force is nearly two thousandth parts of its whole amount greater in December and January, when the earth is nearest to the sun, than in June and July, when the earth is most distant from the sun. The conclusions thus drawn in regard to the annual variations of the Inclination and Total Force are to the same effect as those derived from the more limited sources discussed in the Phil. Trans., p. 1850, Art. IX.

Disturbances unaccompanied by Changes in the Mean Readings of the Magnetometers.—In Part I. (published in 1843) of the volume of "Observations on Days of Unusual Magnetic Disturbance," it was noticed that besides the disturbances which it was the object of that volume to record, characterized by changes in the mean readings of the magnetometers, the magnets were sometimes observed to be disturbed without any notable displacement in their mean position. Disturbances of this class manifest themselves by the magnets being perceived to vibrate in arcs sometimes of smaller and sometimes of larger extent, the vibration being maintained by a succession, at intervals, of slight shocks or impulses, by which, however, the *mean* readings of the magnetometer were not affected. The times of observation in 1841, at which disturbances of this particular character were noticed, were published in 1843, in the volume referred to; a continuation of the record for the years 1842, 1843, 1844, and 1845, will be found in pp. 550 to 557 of the present volume.

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

METEOROLOGICAL INSTRUMENTS.

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

METEOROLOGICAL INSTRUMENTS.

THE meteorological instruments remained in the situations described in Volume I. p. lxxiv. until the end of 1844, when, for the purpose of still further improving their position, the standard and wet thermometers were removed from the angle formed by the exterior wall of the principal room of the Observatory and that of one of the smaller apartments, to a situation prepared for them on the outside and near the middle of the north wall of the principal apartment. An opening made in the wall was fitted with a sliding glass window (through which the thermometers were read), having a wooden shutter on the Observatory side, which was kept closed except at times when observations were made. The thermometers were attached to horizontal strips of wood (leaving the balls perfectly free), about five feet above the ground, six inches on the outside of the wall, and two feet distant from the shutter, having the window intermediate. In this position they were protected by a double projecting roof, and by double enclosures on the east, west, and north sides (the Observatory wall being on the south side), of Venetian blind shutters, descending to within four feet of the ground. The length of the exterior shutter on the north side was 7 feet, and on the east and west sides 5 feet $4\frac{1}{2}$ inches. The space between the exterior and interior roofs and shutters was from one to one and a-half feet. The slope of the blinds of shutters was such as to admit a free current of air, while it completely screened the thermometers from rain.

An accident having happened to the standard thermometer furnished by Newman, mentioned in Vol. I., one of two thermometers made by Adie of Liverpool under Dr. Apjohn's superintendence, which, agreeing remarkably well with each other, had been employed as wet and dry thermometers, was adopted as the standard, and was always used as such except from March to December 1845, and on some few other occasional instances, in all of which corrections carefully ascertained were applied to give the values which would have been read by Adie's standard. The record of the standard thermometer in Vols. I. and II., *i. e.*, from 1841 to December 1845, is therefore throughout according to the scale of this instrument, viz., Adie No. 2.

Circumstances having led Captain Lefroy to doubt the perfect accuracy of the thermometer which had been thus employed as a standard, and the Observatory at Kew not having then undertaken, as it has since done, the construction of standard meteorological instruments, a thermometer was procured through the good offices of M. Regnault, which had been graduated under his superintendence in arbitrary divisions of perfectly equal *thermometric* value. The divisions corresponding to the freezing and boiling points 0° and 100° Centesimal, 32° and 212° Fahrenheit, had been found by the maker, Fastré of Paris, in a preliminary experiment, to be $115\cdot 7$ and $617\cdot 7$

divisions; a repetition of the experiment, at Paris in 1851, by Captain Lefroy and M. Izard, gave 115·5 and 617·6 divisions. The experiment repeated at Toronto in January 1852 gave as follows:—

| FREEZING POINT. | | BOILING POINT. | | | |
|-----------------|------------------------|----------------|--------|---------|--------|
| | Div. | Div. | Barom. | Mms. | Div. |
| January 13 | 116·12 | January 5 | 614·60 | 743·055 | 617·76 |
| ,, 14 | 116·00 | ,, 12 | 616·55 | 755·136 | 617·45 |
| ,, 22 | 116·30 | ,, 13 | 614·00 | 740·866 | 617·57 |
| ,, 28 | 116·22 before boiling. | ,, 28 | 614·10 | 738·530 | 618·12 |
| ,, 28 | 116·10 after boiling. | | | | |
| | <hr/> | | | | |
| | 116·14 | | | | <hr/> |
| | | | | | 617·72 |

whence $116 \cdot 14$ Div^{ns.} = 0 Cent. = 32° Fah^{t.}; and $617 \cdot 72$ Div^{ns.} = 100° Cent. = 212° Fah^{t.}; or 1° Cent. = $5 \cdot 0158$, and 1° Fah^{t.} = $2 \cdot 7865$ divisions.

This last value has been employed in the comparison in preference to the original determination at Paris, from which, however, the difference is extremely small.

The two thermometers, Adie 2 and Fastré, were suspended side by side, and simultaneous readings were made at all actual temperatures that occurred between April 1851, and March 1852; the readings were at first taken with the eye alone, and subsequently with the assistance of a telescope. The comparisons have been grouped under every degree of Fahrenheit between $-3^{\circ}0$ and $+82^{\circ}$, and the mean difference under each degree taken as the correction of Adie 2 at that temperature; the correction for each degree was obtained on the average from about twenty comparisons. The corrections required for the few degrees above 82° , and below -3° have been added by a graphical extension.

TABLE LII.
Corrections to reduce Scale Readings of Thermometer, Adie 2, to absolute temperatures.

The record of the wet thermometer in Vols. I. and II., from 1841 to December 1845, is in terms of the scale of Adie 2, and is consequently affected by the inaccuracies of that thermometer at different points of its scale. The mean monthly values of the wet thermometer in Table LV. of this volume, pp. cviii. to cxi., have been corrected for these inaccuracies, and are therefore true temperatures, and strictly comparable with the mean monthly values of the standard thermometer in Table LIII. pp. c. to ciii. The following Tables, LIII. to LVII., contain the monthly mean values of Fastré's standard thermometer, of the barometer, wet thermometer, and of the humidity and tension, from July 1842 to June 1848 inclusive :—

ADJUSTMENTS, ABSTRACTS, AND COMMENTS.

Corrections to be applied to Thermometric Observations made at Toronto at any hour of the day, for the purpose of giving the corresponding mean temperature of the day.

Table LVIII. (page cxx.) exhibits the mean temperature of every month in the year derived from hourly observations from July 1842 to June 1848 inclusive, as well as the mean monthly temperature at every hour of the twenty-four derived from the same series ; it furnishes, therefore, by inspection, corrections to be applied to the monthly means of thermometric observations made at any hour of mean time, whereby the mean temperature of the *month*, such as would have been given by a mean of twenty-four equidistant observations, may be obtained, approximately at least, from daily observations at a single hour. Many meteorological problems, however, require determinations of mean temperature for shorter periods than monthly ones. In Europe five-day means are in frequent request ; and for some problems even daily means are required. It is desirable therefore that a table should be formed from the mean monthly results in Table LVIII., which may supply, for Toronto and places in its vicinity, the means of deriving from an observation made at any time whatsoever in the course of the twenty-four hours, the best approximation attainable by it to the mean temperature of the *day*, such as would have been given by the mean of twenty-four equidistant observations.

It is now generally recognised that, when a single observer constitutes the whole observing staff, a mean of three equidistant observations in the 24 hours furnishes the most satisfactory approximation to the daily mean temperature which is within his command. The hours of 6 A.M., 2 P.M., and 10 P.M. are those which are usually preferred ; but the frequent substitution of the three non-equidistant hours of 7 A.M., 2 P.M., and 9 P.M., shows that even the least inconvenient combination of three hours having equal intervals, is not always unattended with difficulty.* No combination of three fixed hours of observation will however give an equally good approximation to the mean temperature of the day at all seasons of the year ; and were it only for this reason it is preferable, even when three equidistant observations are made, to apply to each of the observations separately a correction to the mean temperature of the day, based on such a table as LVIII. (founded on a sufficient number of years of observation), and to take the mean of the three observations so corrected for the mean temperature of the day. But the chief advantage of a table of corrections for the purpose of reducing observations at any hour to the mean temperature of the day, is in its

* The hourly series from July 1842 to June 1848, shows that at Toronto 6 A.M., 2 P.M., and 10 P.M., give a nearer approximation, on the average of the year, to the mean of twenty-four hourly observations, than do 7 A.M., 2 P.M., and 9 P.M. But 6½ A.M., 2 P.M., and 9½ P.M., appear to form a combination preferable for this particular purpose to either of the two other combinations.

setting the observer free to select his hours of observation untrammelled by the condition that their uncorrected mean should present of itself a close approximation to the mean temperature of all the hours. It must of course be always desirable that when the observations are few they should be widely separated, as affording a better chance of compensation for transient accidental variations; but absolute or nearly approximate *equidistance* loses a great part of its importance when a table of corrections exists; and the observer is thus placed at greater freedom to choose the hours which may be most suitable either to his convenience, or to other researches in which he may desire to engage, having reference to particular points of meteorological or climatic interest.

Although the application of such a table may, in strictness, be regarded as limited to observations made exclusively at the station from whence it is derived, yet practically such tables are found of considerable value in facilitating the reduction of observations at stations, not too distant, which may be subject for the most part to the same or to similar meteorological influences. In this point of view, Toronto, as a normal station, may perhaps be useful, within reasonable limits, in aiding the reduction and co-ordination of observations in Canada and the United States, such as those which are now in progress on the system proposed by the Smithsonian Institution.

For these objects Table LXV. has been formed from the data contained in Table LVIII. The temperatures on the different days of the year, and at the different hours of the day, have been computed from the several monthly means by the well-known formula usually called Bessel's:—

$$t_x = A_0 + A_1 \cos \alpha + B_1 \sin \alpha + A_2 \cos 2\alpha + B_2 \sin 2\alpha + A_3 \cos 3\alpha + B_3 \sin 3\alpha + A_4 \cos 4\alpha + B_4 \sin 4\alpha + A_5 \cos 5\alpha + B_5 \sin 5\alpha + A_6 \cos 6\alpha;$$

in which t is the temperature on x the required day, A_0 the mean temperature of the year at the hour required, $\alpha = n \times 30^\circ$, n being the number of months and parts of a month between a fixed epoch and x , and $A_1, A_2, \dots, A_6, B_1, B_2, \dots, B_5$ constants derived from the data in Table LVIII. by the method of least squares. From the temperatures thus computed, corrections have been obtained to the mean temperature of the day for every hour of mean astronomical time throughout the year. Table LXV. exhibits these corrections for every hour on every fifth day throughout the year; the corrections on the intermediate days admitting of easy interpolation at sight.

TABLE LXV.

Corrections for every Fifth Day of the Year, to be applied to the Temperature observed at Toronto at any of the hours of Mean Astronomical Time, in order to give the Mean Temperature of the Day.

First Part, January to June. The corrections in the smaller type are subtractive; in the larger type additive.

POSTSCRIPT.

The publication of this volume has been delayed by the necessity of reprinting 456 pages, of which the first impression had been destroyed in the fire which took place at Messrs. Clowes's Printing Office on the 10th June 1852.

EDWARD SABINE.

Woolwich, August 5, 1853.

ERRATA.

Page v. Feb. 1849, for "6·2," read "4·3;" for "1° 35'·2," read "1° 37'·1."
Mean for Feb. 1849, for "1° 36'·9," read "1° 37'·1."
— xxxv. line 25, for "7^h of Toronto time," read "7^h A.M. of Toronto time."
— xcii. — 7, for "Aunular," read "Annual."

TORONTO, 1843.

MAGNETICAL OBSERVATIONS.

TORONTO, 1843. MAGNETICAL OBSERVATIONS.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0' \cdot 721$. Increasing numbers denote decreasing Westerly Declination.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0'721$. Increasing numbers denote decreasing Westerly Declination.

TORONTO, 1843. MAGNETICAL OBSERVATIONS.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0' \cdot 721$. Increasing numbers denote decreasing Westerly Declination.

TORONTO, 1843. MAGNETICAL OBSERVATIONS.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0^{\circ} 721$. Increasing numbers denote decreasing Westerly Declination.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0' \cdot 721$. Increasing numbers denote decreasing Westerly Declination.

The connexion of the series was broken between the 9th and 11th, and again between the 23rd and 25th.

HORIZONTAL FORCE.

From 1st to 9th. One Scale Division = .000074 parts of the H. F. Change in the magnetic moment of the Bar for 1° Fah. = .00027.
 From 10th to 23rd. One Scale Division = .000152 parts of the H. F. Change in the magnetic moment of the Bar not ascertained.
 From 24th to 28th. One Scale Division = .000099 parts of the H. F. Change in the magnetic moment of the Bar for 1° Fah. = .00027.

TORONTO, 1843. MAGNETICAL OBSERVATIONS.

HORIZONTAL FORCE.

From 1st to 9th. One Scale Division = .000099 parts of the H. F.
From 11th to 31st. One Scale Division = .000087 parts of the H. F.

Change in the magnetic moment of the Bar for 1° Fahrt. = .00027.

TORONTO, 1843. MAGNETICAL OBSERVATIONS.

From 1st to 9th. One Scale Division = .000099 parts of the H. F. }
 From 11th to 31st. One Scale Division = .000087 parts of the H. F. } Change in the magnetic moment of the Bar for 1° Fahr. = .000234.

TORONTO, 1843. MAGNETICAL OBSERVATIONS.

VERTICAL FORCE.

One Scale Division = .000094 parts of the V. F.

Change in the magnetic moment of the Bar for 1° Fah. = .000007.

VERTICAL FORCE.

One Scale Division = .000094 parts of the V. F.

Change in the magnetic moment of the Bar for 1° Fahrt. = .00007.

T O R O N T O, 1842-43.

O B S E R V A T I O N S O F T H E A U R O R A.

OBSERVATIONS OF THE AURORA AT TIMES WHEN THE MAGNETOMETERS WERE CONSIDERABLY DISTURBED.

| Toronto Mean Time, Astronomical Reckoning. | Weather and Phenomena. | Moon's Age at Mean Noon. | Toronto Mean Time, Astronomical Reckoning. | Weather and Phenomena. | Moon's Age at Mean Noon. | |
|---|---|-----------------------------------|---|--|--|---|
| APRIL. | | | APRIL. | | | |
| D. H. M. 14 10 24 | Partially clouded; strong light in N. but no remarkable feature | D. 3°8 | D. H. M. 15 08 00 | Very sudden burst of auroral light in the N. in patches, banks, and streamers, which disappeared in a few minutes - | D. | |
| 36 | Clouded round N. horizon; streamers appearing above the clouds - - - - - | - | 35 | A few faint streamers visible in N.; one very large streamer extending from E. to zenith remaining steady - - - | 4°8 | |
| 11 00 | Faint light in N.; a few pulsations in N.W.; some scattered clouds - - - - - | - | 45 | Light in N. fainter; streamer still in the E. but not so near the zenith - - - - - | - | |
| 12 | Faint light; clouding rapidly from N.W. - - - - - | - | 55 | Light in N. the same as the last remark; streamer in E. very bright, longer, and branching like a Y in the zenith - | - | |
| 30 | Calm; faint light in N. almost entirely clouded over with light cir. and cir.-strat. - - - - - | - | 09 00 | Streamer in E. extending across the zenith nearly to W. forming a bright belt across the sky; broader in zenith than at either end - - - - - | - | |
| 36 | Faint light only - - - - - | - | 05 | Streamer in E. diminished considerably, and moving towards the S. - - - - - | - | |
| 54 | Clear in N., light stronger; pulsations very rapid and distinct | - | 10 | Wind springing up from N.W.; streamer in E. disappeared; Aurora brightening up in N.; sky perfectly clear - | - | |
| 12 00 | Luminous band of patches and pulsations extending across the zenith from E. to W.; strong steady light in the N. - - - | - | 25 | Light in N. very faint, in form of an arch; streamer disappeared | - | |
| 06 | Band appearing to have moved about 15° to S. of zenith - - - | - | 40 | Aurora brightening; appearing in form of two arches thus  extending from N.W. to N.E., altitude of the exterior arch about 20°, of interior one about 12°; a few streamers at the Eastern extremity - - - - - | - | |
| 12 | Pulsations converging from every part of the horizon except the S.W. to zenith, and covering the whole sky; light steady in N.; clear except a few cir. in the N.W. - - - - - | - | 45 | Features of the Aurora changing very rapidly from banks to patches and streamers; dying away and suddenly brightening again - - - - - | - | |
| 18 | Light air sprung up from N.; low range of strat. appearing in N. horizon; remainder of the sky perfectly clear; pulsations apparently proceeding from N.E. and crossing the zenith to W. in three distinct bands - - - - - | - | 57 | Remarkably bright bank in N.E. from which a great number of streamers issue; nothing visible to W. of N. - - - | - | |
| 36 | Arch of patches varying their form every moment in N., general altitude about 25°, beneath which light cir.-strat. rests upon the horizon; splendid belt of luminous pulsations across the zenith from E. to W. - - - - - | - | 10 00 | Bright light only in N. - - - - - | - | |
| 54 | Extremely bright and steady light in the N., pulsations converging to zenith from every direction, and forming a most splendid crown or circle of light of a reddish colour - - - | - | 10 | Aurora entirely disappeared; sky perfectly clear - - - | - | |
| 13 00 | Wind N., very light; low bank of strat. in N., remainder of the sky perfectly clear; very vivid pulsation, as before - - - | - | 20 | A streamer in S.E. extending to zenith, but neither so bright nor so well defined as that before-mentioned; a few patches in N. Streamer very bright and extending from S.E. to N.W. inclining to S. of zenith (like a bow); a few bright patches and pulsations in the N. - - - | - | |
| 12 | Wind N., almost calm; range of dense cum.-strat. rising in N., streamers appearing to rise from behind the clouds; pulsations as before - - - - - | - | 25 | A number of banks appearing and disappearing very rapidly in the N.E. and N.W. - - - | - | |
| 24 | Calm; very dense mass of clouds rising in N.; pulsations as before - - - - - | - | 35 | Large streamer again invisible; a few patches occasionally in N. Bright banks in N. and N.E., with slight pulsations - - | - | |
| 42 | Calm, a few detached clouds in N.; streamers very brilliant in N. and N.E.; pulsations remaining as before - - - | - | 15 10 45 | Two faint arches only in N. - - - | - | |
| 14 15 | Pulsations rather diminished in extent and brightness; numberless streamers covering the sky between the W.N.W. and E.N.E. rising to an average altitude of 50°; patches of light extending 20° to the S. of zenith - - - - - | - | 50 | One broad bright arch extending from N.E. to N.W. - - | - | |
| 25 | Features unaltered; pulsations more bright - - - - - | - | 11 00 | No auroral light, except a very faint arch in N. altitude, about 15° - - - | - | |
| 30 | Luminous haze covering 4 of the sky to N.; pulsations as before; streamers disappeared; clouds rising in, and passing over from N.W. - - - - - | - | 40 | The same as at 11h 15m - - - | - | |
| 35 | Range of dense strat. in the N., above which a bright light appears and extends over 4 of the sky; pulsation as before | - | 20 | A number of bright patches and streamers in the N., enclosed in an arch of luminous haze; altitude about 20° - - | - | |
| 40 | Pulsations undiminished in extent, and remarkably bright - - | - | 30 | 40 | A number of bright banks; patches and streamers forming, disappearing, and reforming again very quickly; luminous haze surrounding the whole to an altitude of 25° - - | - |
| 50 | Aurora appearing over about 6 of the sky; a few streamers visible - - - - - | - | 45 | Streamers, patches, and banks becoming fainter, but retaining the same features as before - - - - - | - | |
| 55 | Features unaltered but larger in extent; streamers disappeared | - | 50 | Aurora still the same, but brighter - - - - - | - | |
| 15 10 | Pulsations almost disappeared; faint luminous haze over 5 of the sky - - - - - | - | 55 | Nothing remaining but a faint luminous haze, and a few very faint streamers - - - - - | - | |
| 20 | Pulsations brighter; faint streamers and patches in the N. - - | - | 12 00 | Faint arch of light, and a number of pulsations beginning to vibrate upwards, and disappearing at an altitude of 45° - | - | |
| 35 | The same as 15h 20m - - - - - | - | 05 | The same appearance as last recorded - - - | - | |
| 45 | Faint sheet of light in N., a few pulsations in N.W. - - | - | 10 | Light wind sprung up from the N. by W.; sky perfectly clear; bank of light and faint arch above it in the N.; pulsations proceeding from the N. towards the zenith - | - | |
| 55 | Bank of light brighter; a number of streamers; pulsations continuing - - - - - | - | 30 | Patches and streamers moving backwards and forwards with great rapidity; vivid pulsations - - - - - | - | |
| 16 15 | Bank of light fainter; pulsations gone; light cir.-cum. dispersed over zenith; clouds passing from N.W. - - - | - | 35 | The same appearance as last recorded - - - - - | - | |
| 25 | Wind N. by E.; nearly calm; light indistinct - - - | - | 40 | The same as last recorded, but pulsations rather extended - | - | |
| 35 | Clouded generally over the sky with cir.-cum. and cir.-strat.; daylight breaking; auroral light just perceptible in the N.N.W. - - - - - | - | 45 | Range of streamers suddenly appeared between N.E. and N.W.; pulsations as before - - - | - | |
| 45 | No traces of Aurora - - - - - | - | 50 | Streamers disappeared; pulsations remarkably bright - | - | |
| 17 00 | Wind N., almost calm; about 4 clouded, principally to the E. with cir.-cum. and cir.-strat.; fair - - - - - | - | 55 | Pulsations very vivid and extending from E. to N.W. by N.; bright streamers appearing and disappearing in quick succession - | - | |

OBSERVATIONS OF THE AURORA AT TIMES WHEN THE MAGNETOMETERS WERE CONSIDERABLY DISTURBED.

| Toronto Mean Time, Astronomical Reckoning. | Weather and Phenomena. | Moon's Age at Mean Noon. | Toronto Mean Time, Astronomical Reckoning. | Weather and Phenomena. | Moon's Age at Mean Noon. |
|---|--|-----------------------------------|---|--|-----------------------------------|
| APRIL. | | | | | |
| D. H. M. 15 13 00 | The same appearance as last recorded - - - - - | — | D. H. M. 4 09 22 | JUNE. | D. |
| 05 | Pulsations still very vivid, reaching from S.E. round the N. as far as W. by S. - - - - - | — | 27 | Bow of light disappeared; luminous haze in N., and a few faint streaks of light in zenith alone visible - - - - - | — |
| 10 | Pulsations the same; several bright streamers in N.E. - - - - - | — | 32 | Luminous haze, with very faint patches and streamers in N. - - - - - | — |
| 15 | Pulsations fainter and not so extended; bright streamers in E. and N.E. - - - - - | — | 37 | Appearance nearly the same - - - - - | — |
| 20 | The same appearance as last recorded - - - - - | — | 42 | The same appearance as last recorded, with faint streamers moving from E. to W. - - - - - | — |
| 25 | Pulsations fainter, ranging from E. to N.W. - - - - - | — | 47 | The same appearance; streamers becoming brighter - - - - - | — |
| 30 | Considerably fainter; streamers in N.E. - - - - - | — | 52 | Light much brighter; innumerable streamers extending from E. to W. by N., and rising to an altitude of 50° - - - - - | — |
| 35 | The same as last recorded, but streamers in N. and N.E. fainter | — | 57 | Light fainter; scarcely perceptible; low clouds in N. horizon Patches rather brighter; faint streamers rising above them; a small streamer in the S.E. - - - - - | — |
| 40 | A few faint patches of light, altitude about 15°; pulsations as before reaching to an altitude of 55° - - - - - | — | 10 02 | A faint luminous haze with a few very faint streamers at either end of the light alone visible - - - - - | — |
| 45 | Nearly the same as last recorded; a few faint streamers at intervals - - - - - | — | 07 | Bright light in N.N.E., with bright patches visible behind a low range of clouds in the N.; faint streamers in N.W. - - - - - | — |
| 55 | Bank of luminous haze, altitude about 20°, with a few faint patches; pulsations considerably fainter - - - - - | — | 12 | Clouds rising in the N.; faint light and streamers above them | — |
| 14 00 | Bank rather brighter; pulsations the same; a few faint streamers in N.E. - - - - - | — | 17 | Clouds rising in the N.; faint light and streamers above them; occasional sheet lightning in N.W. - - - - - | — |
| 05 | Very nearly the same as last recorded - - - - - | — | 22 | Calm; bright streamers and pulsations extending from E. to N.W.; patches of light visible behind the clouds - - - - - | — |
| 10 | Calm; clear and unclouded; arch of light, altitude 25°, with a few faint streamers and pulsations - - - - - | — | 27 | Appearance nearly the same; pulsations reaching to an altitude of about 45° - - - - - | — |
| 20 | Arch of light rather brighter, altitude about 30°; very faint pulsations just above it - - - - - | — | 32 | Range of bright streamers extending from E. to N.W.; faint pulsations - - - - - | — |
| 30 | Light and pulsations the same; a few very faint streamers in N.W. - - - - - | — | 37 | About 1 overspread with light cir.-cum. and cir.-strat. in N.; bright streamers in the E. and N.W.; sheet lightning in N.W. - - - - - | — |
| 40 | Bright arch of light from N.E. to N.W., throwing out a few streamers at its N.W. extremity; pulsations just perceptible above the arch - - - - - | — | 42 | A faint light seen behind the clouds; Aurora otherwise disappeared - - - - - | — |
| 50 | Very nearly the same as last recorded - - - - - | — | 47 | Bright streamers and pulsations again breaking out; bright patches of light in N.E. - - - - - | — |
| 15 00 | Arch fainter; faint streamers shooting from it; faint pulsations | — | 52 | Steady patch of light in N.E. and N.N.W.; faint pulsations reaching to an altitude of 50°; sheet lightning in W.N.W. - - - - - | — |
| 10 | Arch of light brighter; streamers and pulsations entirely gone | — | 57 | Light brighter in N.W. and fainter in N.E.; pulsations as before - - - - - | — |
| 20 | Arch of light the same; a few very faint pulsations - - - - - | — | 11 02 | Very bright patches of light, principally in the N.W., and very vivid pulsations over the whole northern portion of the sky; calm; 1 overcast with cir.-cum. and cir.-strat. - - - - - | — |
| 30 | The same as last recorded - - - - - | — | 07 | Patches of light fainter; pulsations continuing - - - - - | — |
| 40 | Arch of light the same; pulsations gone - - - - - | — | 12 | Pulsations remarkably vivid; clouds becoming more dense - - - - - | — |
| 16 00 | Light very faint; calm, clear, and unclouded; Aurora not perceptible - - - - - | — | 15 | Patches of light very faint; pulsations over the whole north portion of the sky - - - - - | — |
| JUNE. | | | | | |
| 4 07 42 | Calm; clear and unclouded, except a few light cir.-strat. in N. horizon; no auroral light visible - - - - - | 25·2 | 17 | Pulsations from all quarters converging to a point in zenith; several splendid streamers rising from behind the clouds in N. - - - - - | — |
| 08 27 | A few patches of light beginning to appear in N.N.W. horizon; the evening not sufficiently advanced to observe their features with accuracy - - - - - | — | 22 | Pulsations fainter; streamers disappeared - - - - - | — |
| 47 | All auroral light disappeared - - - - - | — | 27 | Bright streamers and patches appearing and disappearing with great rapidity; pulsations as before - - - - - | — |
| 52 | Bright waves of light drifting from E. across the zenith, in appearance like light cir. clouds; faint light in N. horizon; sky clear - - - - - | — | 32 | The same appearance as last recorded - - - - - | — |
| 54 | A large stream of light rose in E. horizon, and after passing through zenith sunk in N.W.; the bow remained perfect and appeared to continue its onward motion - - - - - | — | 37 | Streamers, patches and pulsations much fainter - - - - - | — |
| 57 | An innumerable number of faint streamers extending from E. to W., and covering the whole of the N. sky; the bow of light as before; the centre of it passing through a point 10° S. of zenith - - - - - | — | 42 | A few faint streamers and pulsations - - - - - | — |
| 09 02 | A number of small bright streamers in S.E., rising to an altitude of from 10° to 20°; streamers in N. disappeared, except a few in N.E.; strip of light becoming fainter at the western, and brighter in the eastern extremity; the whole gradually moving to the S. - - - - - | — | 47 | Pulsations and light very faint - - - - - | — |
| 09 | A number of remarkably bright patches of light in zenith, having gradually approached from E.; bright patches of light in N. horizon - - - - - | — | 52 | Pulsations and light very faint - - - - - | — |
| 12 | The bow of light still remaining, and appearing to act as a conductor to a constant and steady stream of patches of light which rising in E., and moving its course to zenith, where they disappear; patches of light in N. - - - - - | — | 57 | Aurora disappeared except a faint light in N., with a few very faint streamers; calm; light cir.-cum. and cir.-strat. dispersed round the N. horizon - - - - - | — |
| | | | 12 02 | Faint bank of light, altitude about 20°; sheet lightning in N.W. horizon - - - - - | — |
| | | | 07 | Faint auroral light alone remaining - - - - - | — |
| | | | 12 | Very faint auroral light alone remaining; sheet lightning in the W. and N.W. horizon - - - - - | — |
| | | | 17 | The same appearance as before - - - - - | — |
| | | | 27 | Nearly the same appearance - - - - - | — |
| | | | 37 | Bank of light rather brighter; very faint pulsations just above it - - - - - | — |

OBSERVATIONS OF THE AURORA AT TIMES WHEN THE MAGNETOMETERS WERE CONSIDERABLY DISTURBED.

| Toronto Mean Time, Astronomical Reckoning. | Weather and Phenomena. | Moon's Age at Mean Noon. | Toronto Mean Time, Astronomical Reckoning. | Weather and Phenomena. | Moon's Age at Mean Noon. |
|---|---|-----------------------------------|---|---|-----------------------------------|
| JUNE. | | | | | |
| D. H. M. 4 12 47 | Very faint light; no pulsations - - - - - | — | D. H. M. 12 14 48 | A few clouds in S.E. and S.; streamers and pulsations much diminished, but still ascending to zenith, and there disappearing - - - - - | D. |
| 57 | Nearly the same appearance; calm; zenith clear; cir.-strat. and haze round horizon - - - - - | — | 54 | A few pulsations alone visible - - - - - | — |
| 13 08 | Calm; thin haze in zenith; cir.-strat. and haze round horizon; bright patches of light in N.E. moving backwards and forwards behind the clouds - - - - - | — | 15 00 | Aurora disappeared except a few faint streamers to E. of N. - | — |
| 15 | A very faint light alone visible through the clouds - - - - - | — | 06 | A few pulsations still seen although nearly obscured by the advance of day - - - - - | — |
| 22 | Aurora entirely disappeared; clouds becoming more dense - - - - - | — | 12 | Day rapidly breaking; the auroral light could not any longer be seen; calm; clear and unclouded - - - - - | — |
| 14 02 | Aurora entirely disappeared; calm; overcast with cir.-strat. and thin haze; almost incessant sheet lightning in W. and N.W. - - - - - | — | 1843 | | — |
| 32 | Calm; clouded with cir.-cum. and haze; clouds from N.W. - - - - - | — | MARCH. | | |
| 57 | Calm; clouded with cir.-cum. and haze; clouds from N.W. - - - - - | — | 6 11 00 | Clear and unclouded; faint auroral light in N. - - - - - | 5·4 |
| JULY. | | | | | |
| 3 12 12 | Steady strong light in N., very bright streamers in N.W. and E., in each of which directions pulsations rise and meet in a circle extending to the S. of zenith - - - - - | 24·8 | 12 00 | Clear and unclouded; auroral light in N.; streamers and patches - - - - - | — |
| 18 | The streamers before mentioned remarkably brilliant, more extended, and meeting together in zenith; the whole north one sheet of light with vivid pulsations; clear except a few cir.-cum. scattered - - - - - | — | 13 00 | Bank of auroral light in N.; faint patches and streamers - - - - - | — |
| 24 | Bank of clouds in N.W.; haze in N., behind which pulsations are seen; streamers in N.W. undiminished in brightness, shooting forth broad flashes across the zenith; very bright light in the E. near horizon; streamers as before circling or entwining in every shape - - - - - | — | 14 00 | Clear; appearance of auroral light the same as at last observation - - - - - | — |
| 12 12 30 | Vivid and very broad pulsations and streamers covering the whole northern sky - - - - - | — | 15 00 | Clear bank of auroral light extending from N.W. to N.E., altitude about 5° - - - - - | — |
| 33 | Slight pulsations in N.W., eastern streamers and flashes considerably diminished; light in N. increased and throwing up streamers and pulsations which meet in zenith - - - - - | — | 16 00 | Perfectly clear; light almost disappeared - - - - - | — |
| 42 | Calm, a few cir.-cum. scattered over the N. horizon; pulsations and streamers still rising in N.W. and forming a semicircle across the zenith to N.E.; light very bright from N.E. to N.W. from which a constant succession of pulsations follow each other as waves of the sea, disappearing in the N.E. - - - - - | — | 17 00 | Perfectly clear; light almost disappeared - - - - - | — |
| 48 | The whole very much lessened in brilliancy; pulsations and streamers from N.W. very faint, in N.E. entirely disappeared; waves of light from N. very faint, but still joining those from the W. in zenith - - - - - | — | 18 00 | Clear and unclouded - - - - - | — |
| 54 | Calm; a few cir.-cum. scattered; light in E. nearly gone; pulsations and flashes from N.W. hardly reaching the zenith; arch of light extending from N.W. to N.E., altitude at centre about 20°; occasional slight pulsations - - - - - | — | 19 00 | Clear and unclouded - - - - - | — |
| 13 00 | Streamers in N.W. and light in N. increased, throwing out very bright flashes or waves illuminating all the N.; the whole appearance very brilliant - - - - - | — | 20 00 | Clear and unclouded - - - - - | — |
| 12 | The whole of the N. very brilliantly lighted up with banks, patches, arches, and streamers; the features in constant change; pulsations very rapid - - - - - | — | APRIL. | | |
| 18 | The same appearance as last recorded - - - - - | — | 5 04 00 | Partially overcast with light flexuous cir.-strat. and haze; fair; *4 clear - - - - - | 5·7 |
| 24 | The same appearance as recorded at 18 ^m - - - - - | — | 05 00 | Dense bank of cum. and cum.-strat. in N. and N.W.; dense masses of vapour rolling up from the lake; *3 clear - - - - - | — |
| 30 | Pulsations rather diminished in extent, and motion not so rapid; the other features as before - - - - - | — | 06 00 | *5 clouded with dense masses of cum.-strat.; remainder clear; fair - - - - - | — |
| 36 | The same as last recorded - - - - - | — | 07 00 | *6 overcast with dense cum.-strat.; clear spaces generally - - - - - | — |
| 42 | Rather diminished, but still much the same - - - - - | — | 08 00 | Overcast with cir.-cum.; cum.-strat. and haze - - - - - | — |
| 48 | Diminishing; general features the same - - - - - | — | 09 00 | Detached cir.-cum. passing across the zenith; haze round horizon; *5 clear - - - - - | — |
| 14 00 | Still more faint; pulsations much slower - - - - - | — | 10 00 | Clear except haze round horizon; faint bank of auroral light in the N.; altitude at the centre about 18° - - - - - | — |
| 12 | The whole nearly disappeared; a few flashes, and those at considerable intervals from each other - - - - - | — | 11 00 | *4 clear in zenith and to the S., remainder overcast with cir.-cum. and haze - - - - - | — |
| 24 | The same appearance as last recorded - - - - - | — | 12 00 | Partially overcast with cir.-strat.; cir.-cum. and haze - - - - - | — |
| 36 | Again brightening; pulsations and streamers - - - - - | — | 13 00 | Partially clouded with cir.-strat., cir.-cum. and haze - - - - - | — |
| 42 | Brilliant streamers and flashes from N.W. as at first, but not nearly so bright and vivid; streamers and banks extending from N.W. to N.E.; a few pulsations - - - - - | — | 14 00 | Partially clouded with light cir.; strong auroral light in the N. - - - - - | — |
| JULY. | | | | | |
| 25 09 00 | Clear and unclouded; faint auroral light in N. - - - - - | 27·9 | 15 00 | *4 clear to S., remainder overcast with light cir. and haze - - - - - | — |
| 10 00 | Clear and unclouded; faint auroral light in N. - - - - - | — | 16 00 | Quite clear; bright arch of auroral light with streamers issuing therefrom - - - - - | — |
| 11 00 | Clear and unclouded; faint auroral light in N. - - - - - | — | 17 00 | Clear and unclouded; faint auroral light in the N. - - - - - | — |
| 12 00 | Clear and unclouded; faint auroral light in N. - - - - - | — | 18 00 | Clear except a bank of strat. along the S. horizon; fair - - - - - | — |
| | | | 19 00 | Clear except a range of strat. on S. and W. horizon; fair - - - - - | — |
| | | | 20 00 | Haze and strat. round horizon; zenith clear; fair - - - - - | — |
| | | | 21 00 | Partially clouded round horizon with cir.-cum.; *8 clear; fair - - - - - | — |
| | | | 22 00 | Partially clouded with cir.-cum. and cir.-strat.; *8 clear; fair - - - - - | — |
| | | | 6 08 00 | Clear; double arch of auroral light in the N., altitude of upper edge of the highest one about 48°; of lower 23°; faint streamers at the W. end of the upper arch - - - - - | 6·7 |
| | | | 09 00 | Clear and unclouded; faint auroral light in N. - - - - - | — |
| | | | 10 00 | Clear and unclouded; faint auroral light in N. - - - - - | — |
| | | | 11 00 | Clear and unclouded; faint auroral light in N. - - - - - | — |
| | | | 12 00 | Clear and unclouded; faint auroral light in N. - - - - - | — |

* The Aurora above recorded first appeared on the 3rd, at 10 h. (Sunday), and continued with various changes till 12 h., when the observations were commenced.

TORONTO, 1843.

METEOROLOGICAL JOURNAL.

TORONTO, 1843. METEOROLOGICAL OBSERVATIONS.

| Day. | Weather and Phenomena. | Extent of Cloudy Sky. | | | | Max. Therm. | Min. Therm. | Rain. | Solar Rad. |
|-----------|--|-----------------------|------------------|-------------------|-------------------|-------------|-------------------|-------|------------|
| | | 3 ^h . | 9 ^h . | 15 ^h . | 21 ^h . | | | | |
| JANUARY. | | | | | | | | | |
| 1 | Densely clouded all day, with brisk wind from 12 ^h to 17 ^h ; snow from 18 ^h | 0·3 | — | 1·0 | — | 24·0 | ° | — | 30·9 |
| 2 | Densely clouded; continued snowing to 3 ^h , and again from 10 ^h 20 ^m to 12 ^h ; quite clear at 15 ^h ; brisk wind all day | 1·0 | 1·0 | 0·9 | 0·3 | 27·2 | 1·8 | — | 40·7 |
| 3 | Generally clouded; with brisk wind | 0·3 | 0·4 | 1·0 | 1·0 | 31·7 | 9·4 | — | 31·5 |
| 4 | Clouded; light snow from 10 ^h 50 ^m to 21 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 15·8 | 9·3 | — | 24·7 |
| 5 | Cleared up at 14 ^h and remained so to 18 ^h | 1·0 | 0·1 | 0·8 | 1·0 | 27·5 | 11·7 | — | 32·7 |
| 6 | Densely clouded; brisk wind; rain from 4 ^h 20 ^m to 9 ^h | 1·0 | 1·0 | — | 1·0 | 34·5 | 22·7 | 0·115 | 46·3 |
| 7 | Clouded all day; occasional light rain | 1·0 | 1·0 | — | 1·0 | 42·7 | 32·3 | — | 41·9 |
| 8 | Densely overcast; brisk wind and rain | 1·0 | — | 0·7 | 1·0 | 44·3 | 35·3 | 0·410 | 45·9 |
| 9 | Partially clouded to 3 ^h ; remainder of day densely clouded | 0·7 | 1·0 | 1·0 | 1·0 | 44·9 | 20·5 | 0·230 | 50·7 |
| 10 | Overcast; snow and rain to 6 ^h 30 ^m | 1·0 | 1·0 | 0·6 | 1·0 | 33·6 | 24·0 | 0·940 | 50·8 |
| 11 | Clouded; cir., cir.-cum. and haze | 1·0 | 1·0 | 1·0 | 1·0 | 37·0 | 25·2 | — | 39·0 |
| 12 | Densely clouded; slight rain and snow from 6 ^h to 14 ^h ; slight snow continued from 20 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 33·1 | 27·9 | 0·100 | 36·9 |
| 13 | Densely clouded; slight snow continued to 10 ^h ; slight snow from 19 ^h 30 ^m to 23 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 33·7 | 30·3 | — | 34·1 |
| 14 | Densely clouded | 1·0 | 1·0 | — | 1·0 | 33·6 | 21·2 | — | 33·7 |
| 15 | Clouded | 0·9 | — | 1·0 | 1·0 | 29·9 | 23·7 | — | 30·0 |
| 16 | Overcast; dense haze | 1·0 | 1·0 | 1·0 | 1·0 | 33·7 | 18·2 | — | 35·1 |
| 17 | Overcast; dense haze | 1·0 | 1·0 | 1·0 | 0·8 | 26·2 | 20·1 | — | 25·3 |
| 18 | Partially clouded; a shock of an earthquake was felt this day on Lake St. Peters in Lower Canada | 0·7 | 0·5 | — | 1·0 | 31·5 | 26·4 | — | 32·3 |
| 19 | Densely clouded | 1·0 | 1·0 | 1·0 | 1·0 | 44·2 | 32·7 | — | 58·5 |
| 20 | Thick fog | 1·0 | 1·0 | 1·0 | 0·2 | 44·2 | 32·0 | — | 47·5 |
| 21 | Clear from 3 ^h to 8 ^h ; remainder of the day clouded | 0·0 | 0·1 | — | 1·0 | 41·9 | 34·4 | — | 50·7 |
| 22 | Clouded | 0·6 | — | 0·1 | 1·0 | 55·4 | 32·5 | — | 63·9 |
| 23 | Occasionally clouded and clear; snow from 21 ^h 45 ^m to 22 ^h 20 ^m | 0·7 | 0·4 | 0·4 | 1·0 | 40·7 | 34·1 | — | 49·4 |
| 24 | Clouded; high wind | 0·1 | 1·0 | 0·0 | 0·7 | 36·1 | 30·7 | — | 50·0 |
| 25 | Partially clouded to 7 ^h , when it became quite clear | 0·4 | 0·0 | 0·0 | 0·1 | 36·1 | 28·1 | — | 45·1 |
| 26 | Generally clouded; showers of hail from 9 ^h to 13 ^h | 0·5 | 1·0 | 1·0 | 1·0 | 29·5 | 2·4 | — | 33·3 |
| 27 | Densely clouded; snowing from 10 ^h 30 ^m | 1·0 | 1·0 | 1·0 | 1·0 | 25·5 | 18·4 | — | 33·2 |
| 28 | Snow continued to 3 ^h ; quite clear at 10 ^h ; continued so | 1·0 | 0·1 | — | 0·1 | 30·9 | 24·2 ^a | — | 35·0 |
| 29 | Generally clear to 15 ^h , when it clouded over | 0·0 | — | 1·0 | 1·0 | 30·1 | 6·7 | — | 36·3 |
| 30 | Clouded all day; began to snow at 14 ^h , and turned to rain at 20 ^h | 0·5 | 0·3 | 1·0 | 1·0 | 31·4 | 11·1 | — | 53·0 |
| 31 | Continued raining to 10 ^h , when it ceased | 1·0 | 1·0 | 1·0 | 1·0 | 35·5 | 27·7 | 2·500 | 51·0 |
| FEBRUARY. | | | | | | | | | |
| 1 | Generally clouded; brisk wind and snow from 5 ^h to 8 ^h | 0·4 | 1·0 | 1·0 | 0·1 | 37·1 | 15·4 | — | 35·0 |
| 2 | Partially clouded and calm to 8 ^h ; afterwards clouded and brisk wind | 0·8 | 0·6 | 1·0 | 1·0 | 19·7 | -2·7 | — | 36·0 |
| 3 | Densely clouded; light winds; a few particles of snow occasionally | 1·0 | 1·0 | 1·0 | 1·0 | 24·7 | 5·1 | — | 34·6 |
| 4 | Clouded nearly all day; calm, and light wind with slight snow; high wind from 21 ^h | 0·7 | 1·0 | — | 1·0 | 27·5 | 15·7 | — | 29·5 |
| 5 | Clouded; constant snow; high wind continued to 14 ^h | 1·0 | — | 1·0 | 1·0 | 32·3 | 23·8 | — | 59·9 |
| 6 | Clouded; high wind; heavy drift of snow all day | 1·0 | 1·0 | 0·5 | 0·8 | 28·1 | 11·7 | — | 43·1 |
| 7 | Clouded; moderate and light winds | 1·0 | 1·0 | 1·0 | 1·0 | 17·2 | 3·1 | — | — |
| 8 | Overcast to 3 ^h ; partially clear from 4 ^h to 14 ^h ; halo round the moon at 11 ^h | 1·0 | 0·1 | 1·0 | 1·0 | 18·4 | 9·2 | — | 47·5 |
| 9 | Clouded all day; chiefly cir.-strat., cir., and cum.-strat.; light winds | 1·0 | 1·0 | 1·0 | 1·0 | 18·9 | 2·1 | — | 26·0 |
| 10 | Overcast; wind brisk and squally; rain and sleet | 1·0 | 1·0 | 0·9 | 0·9 | 21·9 | 10·3 | 0·475 | 35·7 |
| 11 | Partially clear; snow showers at intervals; brisk wind | 0·4 | 0·3 | — | 0·2 | 38·5 | 21·3 | — | 36·3 |
| 12 | Densely clouded from 12 ^h to 17 ^h ; halo round the moon at 12 ^h ; light wind; parhelion at 23 ^h | 0·5 | — | 1·0 | 0·5 | 24·0 | 11·8 | — | 36·4 |
| 13 | Generally clouded; cir., cir.-strat., and cum.-strat.; halo round moon at 10 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 16·6 | 12·4 | — | 29·7 |
| 14 | Overcast; cir. and haze; snowing most of the day; brisk wind; ceased snowing at 12 ^h | 1·0 | 1·0 | 1·0 | 0·8 | 21·5 | 12·3 | — | 49·9 |
| 15 | Mostly clouded; cum., cir.-cum., and haze; slight snow and sleet occasionally; brisk wind from 18 ^h | 1·0 | 0·5 | 1·0 | 0·1 | 11·9 | 5·1 | — | — |
| 16 | Generally clear; brisk wind continued to 4 ^h ; subsequently light winds | 1·0 | 0·1 | 0·1 | 0·7 | 19·3 | 5·5 | — | 29·4 |
| 17 | Partially clouded, with moderate and light winds | 0·8 | 0·9 | 0·1 | 0·4 | 15·2 | -9·4 | — | 26·8 |
| 18 | Partially clear to 6 ^h ; remainder of day clouded; light wind; began to snow at 21 ^h | 0·8 | 1·0 | — | 1·0 | 15·2 | -8·0 | — | 33·3 |
| 19 | Clouded to 12 ^h ; constant snow continued to 10 ^h 30 ^m , when it ceased | 1·0 | — | 0·5 | 0·2 | 18·3 | 5·7 | — | 38·7 |
| 20 | Partially clear to 3 ^h , slight snow at 16 ^h 30 ^m | 0·9 | 1·0 | 1·0 | 1·0 | 22·5 | -0·3 | — | 26·9 |
| 21 | Generally clouded; light snow | 1·0 | 0·2 | 1·0 | 1·0 | 26·9 | 9·1 | — | 52·4 |
| 22 | Partially clouded to 7 ^h ; clear to 12 ^h ; subsequently overcast with haze; slight snow occasionally | 0·4 | 0·0 | 1·0 | 0·1 | 29·9 | 11·6 | — | 37·5 |
| 23 | Mostly clear to 8 ^h ; subsequently overcast with cir.-strat. and haze | 0·2 | 1·0 | 1·0 | 1·0 | 23·4 | 1·9 | — | 38·5 |

| FEBRUARY. | | | | | | | | | |
| 24 | Clouded and calm - - - - - | 1·0 | 1·0 | 1·0 | 0·8 | 19·9 | 5·5 | In. | 33·9 |
| 25 | Mostly clouded with cir.-cum. and cir.-strat.; a few flakes of snow - - - - - | 1·0 | 1·0 | — | 1·0 | 28·5 | 14·7 | — | 50·5 |
| 26 | Clouded all day; snow from 3 ^h to 13 ^h - - - - - | 1·0 | — | 1·0 | 1·0 | 34·7 | 24·1 | — | 47·0 |
| 27 | Clouded and snowing to 19 ^h ; partially clear to 23 ^h , when the day became clouded - - - - - | 1·0 | 1·0 | 1·0 | 0·3 | 31·6 | 19·7 | — | 42·7 |
| 28 | Clouded all day - - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 29·1 | 19·5 | — | 43·5 |
| MARCH. | | | | | | | | | |
| 1 | Clouded to 8 ^h and occasional slight snow; clear and clouded alternately from 8 ^h , with haze round horizon - - - - - | 1·0 | 0·5 | 0·1 | 0·1 | 29·9 | 12·4 | — | 43·2 |
| 2 | Clouded and clear alternately; cir.-cum. and cir.-strat. till 2 ^h ; totally clouded from 2 ^h - - - - - | 1·0 | 0·1 | 1·0 | 1·0 | 21·9 | 7·3 | — | 29·0 |
| 3 | Clouded and dull to 13 ^h , when it cleared up - - - - - | 1·0 | 1·0 | 1·0 | 0·1 | 20·9 | 1·9 | — | 33·7 |
| 4 | Partially clouded to 6 ^h with cir.-cum. detached - - - - - | 0·3 | 0·0 | — | 0·1 | 23·1 | 2·5 | — | 35·5 |
| 5 | Clear and calm; faint auroral light from 14 ^h - - - - - | 0·0 | — | 0·0 | 0·0 | 26·7 | -2·5 | — | 51·9 |
| 6 | Clear all day; Aurora from 7 ^h to 14 ^h ; slight appearance of a comet - - - - - | 0·0 | 0·0 | 0·0 | 0·0 | 24·5 | 5·7 | — | 40·5 |
| 7 | Clear to 15 ^h ; remainder partially clouded with light cir. and haze; slight appearance of comet at 7 ^h - - - - - | 0·0 | 0·0 | 0·7 | 0·9 | 26·5 | -2·4 | — | 42·2 |
| 8 | Dull and clouded with cir.-cum., cum.-strat. and haze to 13 ^h ; clearing gradually to 17 ^h ; partially clouded to 23 ^h ; halo round the sun from 21 ^h to 23 ^h - - - - - | 1·0 | 1·0 | 0·2 | 0·6 | 27·1 | 7·1 | — | 49·2 |
| 9 | Overcast at night; halo round the moon; clouded - - - - - | 1·0 | 0·2 | 1·0 | 1·0 | 30·2 | 14·7 | — | 41·0 |
| 10 | Clouded all day; snow and sleet; wind fresh and gusty; partially clouded with cir.-cum. and cum.-strat. from 20 ^h - - - - - | 1·0 | 1·0 | 1·0 | 0·8 | 31·3 | 16·3 | 0·250 | 52·3 |
| 11 | Partially clouded with cir.-cum., and cum.-strat. to 3 ^h ; wind brisk and gusty; clear and calm from 4 ^h to 11 ^h ; partially clouded from 21 ^h - - - - - | 0·2 | 0·0 | — | 0·0 | 34·7 | 28·2 | — | 36·7 |
| 12 | Partially clouded to 3 ^h ; snow fell continuously from 11 ^h 50 ^m - - - - - | 0·7 | — | 1·0 | 1·0 | 31·7 | 3·9 | — | 44·7 |
| 13 | Snow continued falling to 7 ^h ; halo round the moon at 9 ^h ; remainder clouded with cir.-cum. and cum.-strat. - - - - - | 1·0 | 1·0 | 1·0 | 0·2 | 32·7 | 24·7 | — | 44·2 |
| 14 | Partially clouded to 3 ^h ; halo and parhelia round the sun at 4 ^h ; halo round the moon at night - - - - - | 0·5 | 1·0 | 1·0 | 1·0 | 38·1 | 12·3 | — | 46·1 |
| 15 | Clouded with cir.-cum. and haze to 8 ^h ; high wind; remainder light cir. and haze; halo round the moon at 14 ^h and 15 ^h - - - - - | 1·0 | 0·1 | 1·0 | 1·0 | 31·1 | 17·7 | — | 39·4 |
| 16 | Overcast with cir.-strat., cir.-cum. and haze; constant snow from 8 ^h to 20 ^h - - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 32·1 | 6·9 | — | 43·3 |
| 17 | Densely overcast with haze to 10 ^h - - - - - | 1·0 | 1·0 | 0·4 | 1·0 | 29·8 | 19·1 | — | 44·7 |
| 18 | Generally clouded; a few flakes of snow occasionally during the day; halo round the sun at 21 ^h , diameter 30° - - - - - | 1·0 | 0·6 | — | 0·2 | 33·4 | 17·3 | — | 39·7 |
| 19 | Nearly clear in the morning; halo round the moon at 14 ^h - - - - - | 1·0 | — | 0·4 | 1·0 | 29·7 | 19·1 | — | 42·3 |
| 20 | Generally clouded; a few flakes of snow between 4 ^h and 5 ^h - - - - - | 1·0 | 1·0 | 1·0 | 0·4 | 31·7 | 15·3 | — | 45·7 |
| 21 | Partially clouded; cir.-cum. dispersed and light cir.-strat. and haze; halo round the moon at 16 ^h and 17 ^h - - - - - | 0·3 | 0·9 | 1·0 | 1·0 | 30·2 | 17·9 | — | 37·5 |
| 22 | Overcast with light cir. and haze; occasional slight snow till 2 ^h ; remainder of the day dense haze - - - - - | 0·6 | 1·0 | 1·0 | 1·0 | 29·7 | 11·1 | — | 41·9 |
| 23 | High wind; snow and drift to 13 ^h , when snow ceased and wind moderated - - - - - | 1·0 | 0·7 | 0·1 | 0·1 | 33·6 | 11·9 | — | 49·7 |
| 24 | Generally clear; halo round the sun at 3 ^h , 4 ^h , and 5 ^h ; clouded over at 12 ^h ; almost clear to 22 ^h ; clouded from 22 ^h - - - - - | 0·2 | 0·2 | 1·0 | 0·1 | 18·7 | 10·7 | — | 29·5 |
| 25 | Continued clouded to 8 ^h ; slight snow occasionally; quite clear at 11 ^h - - - - - | 1·0 | 0·8 | — | 0·0 | 26·7 | 14·4 | — | 46·7 |
| 26 | Nearly clear during the day; overcast with haze from 12 ^h ; constant snow and heavy drift from 20 ^h - - - - - | 0·3 | — | 1·0 | 1·0 | 30·7 | 5·9 | — | 40·3 |
| 27 | Snow and heavy drift continued to 14 ^h , when it turned to rain; very high wind - - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 35·9 | 18·9 | 0·375 | 60·0 |
| 28 | Constant rain and high wind to 6 ^h 30 ^m , when it became almost calm, and the rain ceased; cleared rapidly from 11 ^h to 12 ^h ; clear from 12 ^h to 17 ^h ; partially clouded from 18 ^h to 19 ^h - - - - - | 1·0 | 1·0 | 0·2 | 1·0 | 34·5 | 25·9 | — | 37·9 |
| 29 | Generally clouded all day with cir.-cum. and cum., with clear spaces - - - - - | 0·9 | 0·5 | 0·9 | 0·6 | 39·9 | 19·3 | — | 54·6 |
| 30 | Partially clouded with cir., cir.-strat., and cir.-cum. to 2 ^h ; remainder of the day densely clouded; snow from 10 ^h to 17 ^h - - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 35·9 | 18·5 | — | 53·2 |
| 31 | Densely overcast; constant snow and much drift to 13 ^h ; remainder clouded - - - - - | 1·0 | 1·0 | 1·0 | 0·8 | 30·9 | 22·2 | — | 51·7 |
| APRIL. | | | | | | | | | |
| 1 | Generally clouded with cir.-cum. and cum.-strat.; clear at 10 ^h ; some slight snow - - - - - | 0·6 | 0·8 | — | 0·1 | 30·6 | 21·1 | — | 37·9 |
| 2 | Clear to 18 ^h ; light cir.-cum. to 20 ^h ; clear from 20 ^h - - - - - | 0·0 | — | 0·0 | 0·1 | 34·9 | 14·7 | — | 50·2 |
| 3 | The day and night clear; morning generally clouded - - - - - | 0·0 | 0·0 | 0·1 | 1·0 | 39·1 | 15·3 | — | — |
| 4 | Generally clouded; snow from 1 ^h 40 ^m to 9 ^h 50 ^m ; remainder of day hazy | 1·0 | 1·0 | 0·5 | 1·0 | 39·4 | 23·1 | — | — |

| APRIL. | | | | | | | | | |
| 5 | Hazy and partially clouded with cir.-cum.; auroral light in N. from 10 ^h to 17 ^h | 0·7 | 0·5 | 0·6 | 0·2 | 38·3 | 26·2 | — | — |
| 6 | Generally clouded to 7 ^h ; occasional showers of hail; aurora from 8 ^h to 14 ^h , and clear; partially clouded from 18 ^h to 0 ^h | 0·9 | 1·0 | 0·0 | 0·7 | 41·6 | 28·4 | — | — |
| 7 | Partially clouded with light cir. and haze; halo round the moon from 8 ^h to 10 ^h | 1·0 | 1·0 | 1·0 | 0·8 | 42·9 | 25·2 | — | — |
| 8 | Generally clouded with cir.-cum., cir.-strat. and haze; very slight rain from 6 ^h to 9 ^h | 0·8 | 1·0 | — | 1·0 | 44·9 | 33·5 | — | — |
| 9 | Clouded generally with cir.-cum. and cum.-strat.; brisk wind | 0·5 | — | 1·0 | 0·2 | 49·9 | 30·2 | — | — |
| 10 | Clear all day except a few light cir. and cir.-strat.; clouds on horizon | 0·0 | 0·0 | 0·1 | 0·1 | 43·8 | 31·3 | — | — |
| 11 | Clear, except a few cir.-cum. and cir.-strat. occasionally appearing | 0·1 | 0·0 | 0·0 | 0·0 | 44·4 | 29·5 | — | — |
| 12 | Quite clear to 19 ^h ; densely clouded with cir.-cum. and haze from 19 ^h | 0·0 | 0·0 | 0·0 | 1·0 | 49·8 | 27·4 | — | — |
| 13 | Densely clouded with cir.-cum. and haze | 1·0 | 1·0 | — | 1·0 | 53·8 | 32·7 | — | — |
| 14 | Generally clouded with cir.-cum. and haze; foggy | 1·0 | — | 1·0 | 1·0 | 50·2 | 37·4 | — | — |
| 15 | Generally clouded with cir.-cum. and haze | 1·0 | 0·6 | — | 0·4 | 54·6 | 35·5 | — | — |
| 16 | Partially clouded with cir.-cum. and cir.-strat.; halo round the sun from 19 ^h to 23 ^h , diameter about 30° | 1·0 | — | 0·1 | 1·0 | 56·0 | 37·7 | — | — |
| 17 | Overcast; light cir. and haze; heavy snow from 19 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 53·3 | 36·2 | — | — |
| 18 | Clouded all day with cir.-cum. and haze; heavy snow continued to 2 ^h 20 ^m ; turned to rain; ceased at 8 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 47·4 | 34·2 | 0·680 | — |
| 19 | Clouded with cir.-cum., cum.-strat. and haze to 22 ^h ; partially clouded from 22 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 37·4 | 33·7 | — | — |
| 20 | Partially clouded to 8 ^h ; remainder clear, save light haze; halo round the moon at 14 ^h and 15 ^h , diameter 30° | 0·5 | 0·1 | 0·0 | 0·0 | 43·5 | 35·6 | — | — |
| 21 | Clear to 8 ^h ; remainder of day partially clouded with light cir.-cum., cir.-strat. and haze | 0·1 | 0·7 | 1·0 | 0·5 | 50·3 | 31·2 | — | — |
| 22 | Clouded to 4 ^h with cir.-cum., when it began to rain and continued to 12 ^h | 1·0 | 1·0 | — | 1·0 | 59·8 | 43·2 | 0·550 | — |
| 23 | Cloudy; cir.-cum., cum.-strat. and haze; rain at 16 ^h | 0·7 | — | 1·0 | 1·0 | 56·3 | 42·5 | 0·300 | — |
| 24 | Densely clouded all day with cum.-strat.; cir.-strat. and haze | 1·0 | 1·0 | 1·0 | 1·0 | 64·7 | 48·2 | — | — |
| 25 | Partially clouded to 12 ^h , sheet lightning and densely clouded to 17 ^h ; showers of rain at 18 ^h , 19 ^h , and 20 ^h | 0·2 | 0·2 | 1·0 | 1·0 | 58·8 | 43·7 | — | — |
| 26 | Clouded; lightning and thunder at 8 ^h ; rain from 14 ^h to 21 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 53·8 | 41·7 | 0·055 | — |
| 27 | Clear and calm | 0·8 | 0·1 | 0·1 | 0·1 | 62·5 | 40·7 | 0·800 | — |
| 28 | Generally clear, except detached cir.-cum. dispersed about | 0·8 | 0·1 | 1·0 | 1·0 | 59·5 | 37·7 | 0·050 | — |
| 29 | Clouded to 1 ^h ; remainder partially clouded with cir.-strat.; commenced to rain at 20 ^h ; and became constant from 21 ^h | 0·6 | 0·3 | — | 1·0 | 71·6 | 38·2 | — | — |
| 30 | Constant rain continued to 7 ^h ; clouded densely with cir.-cum. and cum.-strat. | 1·0 | — | 0·7 | 1·0 | 43·1 | 37·2 | 0·750 | — |
| MAY. | | | | | | | | | |
| 1 | Densely clouded all day with cir.-cum. and cum.-strat.; halo round the sun from 18 ^h , diameter 40° to 35°; parhelion at 19 ^h | 1·0 | 1·0 | 1·0 | 1·0 | 47·9 | 35·7 | — | — |
| 2 | Halo continued round the sun to 3 ^h ; clear from 7 ^h | 1·0 | 0·0 | 0·0 | 0·1 | 44·8 | 32·1 | — | — |
| 3 | Partially clouded with cir., cir.-strat. and haze; clear at 5 ^h | 0·5 | 0·3 | 0·7 | 1·0 | 51·8 | 29·2 | — | — |
| 4 | Generally clouded; cir. and haze; very slight rain from 1 ^h to 2 ^h , 5 ^h to 7 ^h , and 10 ^h to 12 ^h | 1·0 | 1·0 | 0·6 | 1·0 | 53·8 | 37·7 | — | — |
| 5 | Densely clouded all day with cir.-cum. and cum.-strat.; brisk wind from N.E. and E.; slight shower of rain at 21 ^h 45 ^m | 1·0 | 1·0 | 1·0 | 1·0 | 47·4 | 36·7 | — | — |
| 6 | Densely clouded; cir., cir.-cum. and haze; halo and lightning at 9 ^h | 1·0 | 1·0 | — | 0·1 | 47·9 | 38·0 | — | — |
| 7 | Partially clear to 3 ^h ; remainder clouded with cir.-cum. and haze | 0·7 | — | 1·0 | 1·0 | 58·0 | 40·7 | — | — |
| 8 | Clouded with cum.-strat. and cir.-cum. to 9 ^h ; remainder of day quite clear | 1·0 | 0·2 | 0·0 | 0·7 | 64·0 | 44·7 | — | — |
| 9 | Generally clouded with cum. and cir.-cum.; occasionally a few clear spaces | 1·0 | 1·0 | 1·0 | 1·0 | 57·0 | 31·9 | — | — |
| 10 | Uniformly clouded all day; rain from 7 ^h to 12 ^h | 1·0 | 1·0 | 1·0 | 0·3 | 58·3 | 46·0 | 0·190 | — |
| 11 | Generally clear, except light cir. and haze; double halo from 8 ^h to 10 ^h , single halo from 10 ^h to 13 ^h | 0·0 | 0·1 | 0·2 | 0·0 | 57·8 | 46·5 | — | — |
| 12 | Mostly clear to 6 ^h ; remainder clouded with cir., cir.-cum. and haze | 0·3 | 1·0 | 1·0 | 0·8 | 65·5 | 42·7 | — | — |
| 13 | Partially clear most of the day; occasionally entirely clouded with cir.-cum. and cum.-strat. | 0·2 | 1·0 | — | 0·6 | 70·0 | 48·5 | — | — |
| 14 | Partially clouded with cum.-strat. and cir.-cum.; lightning and thunder from 12 ^h to 14 ^h ; rain at 23 ^h 30 ^m | 0·4 | — | 0·8 | 0·4 | 72·8 | 51·0 | — | — |
| 15 | Loud peal of thunder at 0 ^h ; partially clouded all day with cum. and cum.-strat. | 0·6 | 0·7 | 1·0 | 0·0 | 71·3 | 51·0 | — | — |
| 16 | Generally clear; a few clouds appeared occasionally; detached cir.-cum. | 0·1 | 0·0 | 0·0 | 0·1 | 79·8 | 49·2 | — | — |
| 17 | Generally clear; a few cir.-cum. and cir.-strat. appeared; wind shifted at 6 ^h from S. to N.N.E. | 0·6 | 0·1 | 0·4 | 0·2 | 67·3 | 35·7 | — | — |

| NOVEMBER. | | | | | | | | | |
| 29 | Clouded to 18 ^h with cir.-cum. and cum.-strat.; a few light showers of snow; faint auroral light in the N. at 7 ^h ; partially clear from 18 ^h to 22 ^h ; clouded with cir.-cum. and haze from 22 ^h - - - - | 1·0 | 1·0 | 1·0 | 0·3 | 30·9 | 21·5 | - | - |
| 30 | Clouded all day with cir.-cum. and haze - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 34·3 | 22·7 | - | - |
| DECEMBER. | | | | | | | | | |
| 1 | Clouded all day with cir.-cum., cum.-strat., and haze - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 30·7 | 24·7 | - | - |
| 2 | Clouded to 2 ^h ; remainder of the day mostly clear - - - - | 0·6 | 0·1 | - | 0·0 | 33·9 | 27·7 | - | - |
| 3 | Generally clear; from 21 ^h clouded with cir.-cum., cir.-strat., and haze - - - - | 0·2 | - | 0·0 | 0·0 | 36·9 | 22·2 | - | - |
| 4 | Clouded all day with cir.-cum., cir.-strat., and haze; slight rain at 4 ^h , and constant snow from 12 ^h to 19 ^h 20 ^m - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 37·3 | 29·2 | - | - |
| 5 | Generally clouded all day with cir.-cum. and cum.-strat. - - - - | 0·7 | 1·0 | 1·0 | 1·0 | 42·4 | 24·1 | - | - |
| 6 | Clouded all day with cir.-cum. and haze; snowing from 0 ^h to 8 ^h - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 27·7 | 12·4 | - | - |
| 7 | Clouded all day with cir.-cum. and haze; snowing from 0 ^h to 8 ^h - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 31·9 | 25·7 | - | - |
| 8 | Clouded all day with cir.-cum., cir.-strat., and haze; halo round the moon from 10 ^h to 11 ^h , diameter about 40°; began to snow at 23 ^h 30 ^m - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 31·9 | 27·2 | - | - |
| 9 | Snow ceased at 2 ^h 40 ^m ; clouded till 5 ^h with cir.-cum. and haze; remainder of the day nearly clear - - - - | 1·0 | 0·1 | - | 1·0 | 32·9 | 25·2 | - | - |
| 10 | Clouded all day with cir.-cum., cir.-strat., and haze; halo round the moon at 14 ^h , diameter about 40°, imperfect - - - - | 1·0 | - | 1·0 | 1·0 | 33·1 | 17·3 | - | - |
| 11 | Generally clouded to 10 ^h with cir.-cum. and cum.-strat.; partially clouded to 21 ^h ; faint auroral light in N. at 7 ^h and 8 ^h ; squalls of wind with sleet between 6 ^h and 7 ^h ; clear from 21 ^h - - - - | 0·4 | 0·8 | 0·3 | 1·0 | 37·5 | 25·3 | - | - |
| 12 | Clear to 18 ^h ; high wind; clouded with cir.-cum. and haze from 18 ^h to 21 ^h ; remainder of day partially clear - - - - | 0·1 | 0·0 | 0·0 | 1·0 | 38·1 | 13·9 | - | - |
| 13 | Partially clear and clouded alternately throughout the day; halo round the sun at 0 ^h , and round the moon at 12 ^h , both imperfect; diameters respectively about 30° and 35° - - - - | 0·1 | 1·0 | 0·2 | 0·8 | 18·7 | 3·1 | - | - |
| 14 | Clouded all day with cir.-cum., cir.-strat., and haze - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 31·9 | 14·4 | - | - |
| 15 | Clouded all day with cir. and haze; constant rain and snow from 2 ^h - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 38·4 | 31·7 | 0·450 | - |
| 16 | Rain continued to 6 ^h ; clouded all day with dense haze - - - - | 1·0 | 1·0 | - | 1·0 | 38·1 | 33·2 | 0·400 | - |
| 17 | Clouded all day with cir.-cum. and haze; slight rain from 12 ^h to 14 ^h ; snow from 14 ^h to 21 ^h 15 ^m - - - - | 1·0 | - | 1·0 | 1·0 | 35·1 | 28·7 | - | - |
| 18 | Clouded all day with cir.-cum. and haze - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 38·7 | 29·7 | - | - |
| 19 | Clouded all day with cir.-cum. and haze - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 33·9 | 27·7 | - | - |
| 20 | Clouded all day with cir.-cum., cir.-strat. and haze - - - - | 0·9 | 1·0 | 1·0 | 1·0 | 34·6 | 28·7 | - | - |
| 21 | Partially clear from 1 ^h to 8 ^h ; remainder of day densely clouded - - - - | 0·9 | 1·0 | 1·0 | 1·0 | 48·5 | 33·2 | - | - |
| 22 | Clouded all day with cir., cir.-cum. and haze - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 38·9 | 28·7 | - | - |
| 23 | Clouded all day with cir.-cum. and haze; raining from 1 ^h to 11 ^h - - - - | 1·0 | 1·0 | - | 1·0 | 38·4 | 31·5 | 0·090 | - |
| 24 | Clouded all day with cir.-cum. and haze - - - - | 1·0 | - | - | 1·0 | 35·3 | 33·2 | - | - |
| 25 | Clouded all day with cir.-cum., cir.-strat. and haze - - - - | 0·9 | - | 1·0 | 1·0 | 39·8 | 32·7 | - | - |
| 26 | Clouded all day with cir.-cum. and haze; high wind; slight rain from 3 ^h to 14 ^h - - - - | 1·0 | 1·0 | 1·0 | 0·7 | 38·7 | 28·7 | 0·100 | - |
| 27 | Clouded all day with cir.-cum. and haze - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 39·7 | 34·7 | - | - |
| 28 | Clouded all day with cir.-cum. and haze; slight snow from 0 ^h to 4 ^h - - - - | 1·0 | 1·0 | 1·0 | 1·0 | 40·8 | 31·7 | - | - |
| 29 | Generally clouded with cir.-cum. and cum.-strat.; a few clear spaces at intervals - - - - | 1·0 | 0·9 | 0·6 | 0·6 | 37·7 | 24·7 | - | - |
| 30 | Generally clear all day - - - - | 0·1 | 0·0 | - | 0·5 | 28·5 ^a | 25·2 ^a | - | - |
| 31 | Partially clouded with light cir.-strat. - - - - | 0·2 | - | 0·0 | 1·0 | 30·7 | 25·7 | - | - |

^a Taken from the highest and lowest readings of the Standard Thermometer.

TORONTO, 1844.

MAGNETICAL OBSERVATIONS.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = 0° 721. Increasing numbers denote decreasing Westerly Declination.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0' 721$. Increasing numbers denote decreasing Westerly Declinations.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0^{\circ} 721$. Increasing numbers denote decreasing Westerly Declination.

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0' \cdot 721$. Increasing numbers denote decreasing Westerly Declination.

* The Scale readings in this and following months require a correction of $4 \cdot 63$ divisions to be added to them in order to connect them with the Scale readings in the month of August.

| DECLINATION. | | | | | | | | | | | | |
|--|------------------|------------------|------------------|------------------|------------------|------------------|------------------|--------------------|------------------|------------------|------------------|----------|
| Angular Value of One Scale Division of the Declinometer = 0° 721. Increasing numbers denote decreasing Westerly Declination. | | | | | | | | | | | | |

DECLINATION.

Angular Value of One Scale Division of the Declinometer = $0' \cdot 721$. Increasing numbers denote decreasing Westerly Declination.

VERTICAL FORCE.

One Scale Division = .000062 parts of the V. F.

Change in the magnetic moment of the Bar for 1° Fabt. = .00007.
